

STATUS OF YELLOWFIN TUNA IN THE EASTERN PACIFIC OCEAN IN 2010

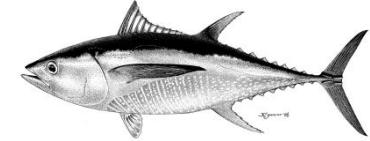

January 1975 – December 2010

J. Spencer '98

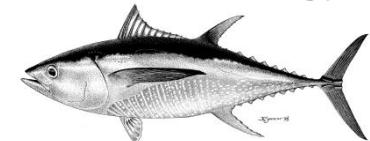

Outline

- Stock assessment (base case model)
 - Methodology (Stock Synthesis)
 - Fishery data
 - Model assumptions
 - Results (fishing mortality, recruitment, biomasses, others)
 - Retrospective analysis
 - Comparison to previous assessment (SAC1)
 - Stock status (base case)
 - Simulations (projections with *status quo* and F_{MSY})
- Sensitivity analyses
- Summary conclusions

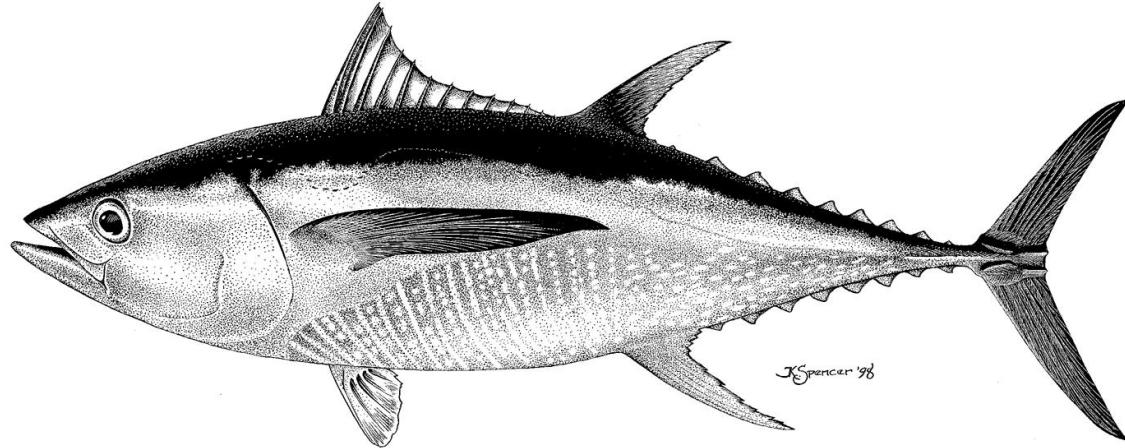

Overview of assessment model

- Age-structured, statistical, catch-at-length model (Stock Synthesis – version 3.20b)
- Integrated analysis
- Same type of model as MULTIFAN-CL, A-SCALA and CASAL

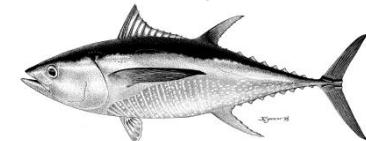

Fishery data

- Catches
- Fishery definitions
- Discards
- Fishing effort
- Catch-per-unit-effort (CPUE)
- Size-compositions

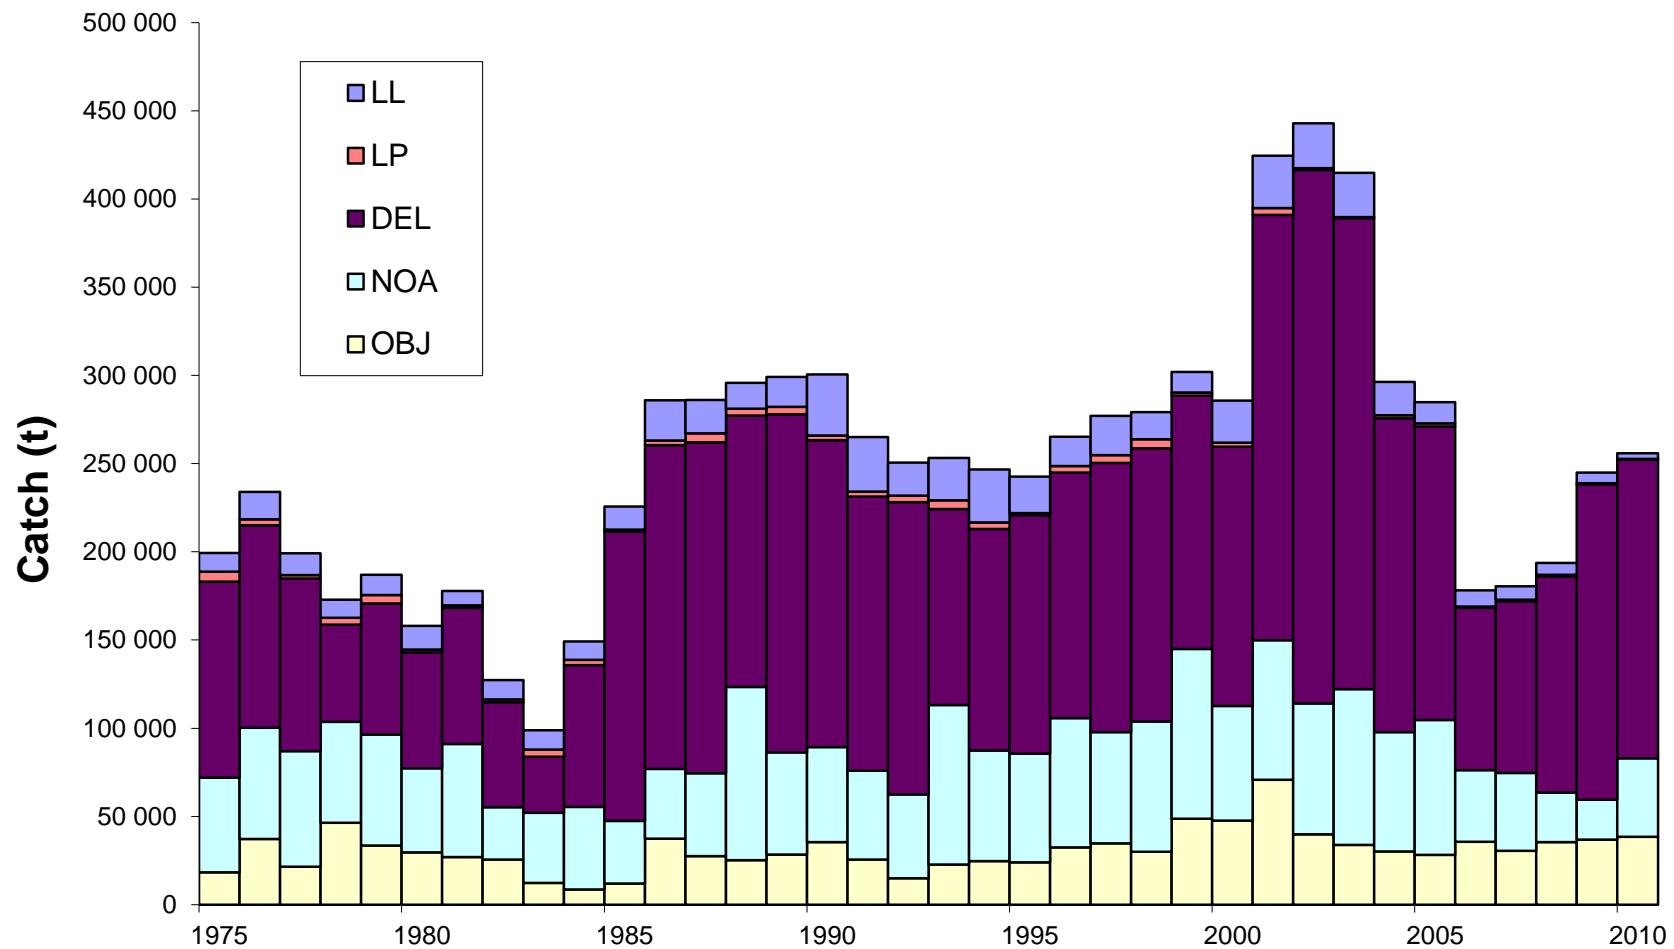

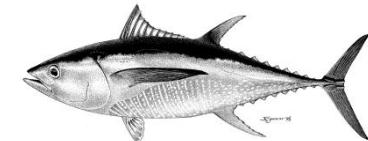

New or updated data

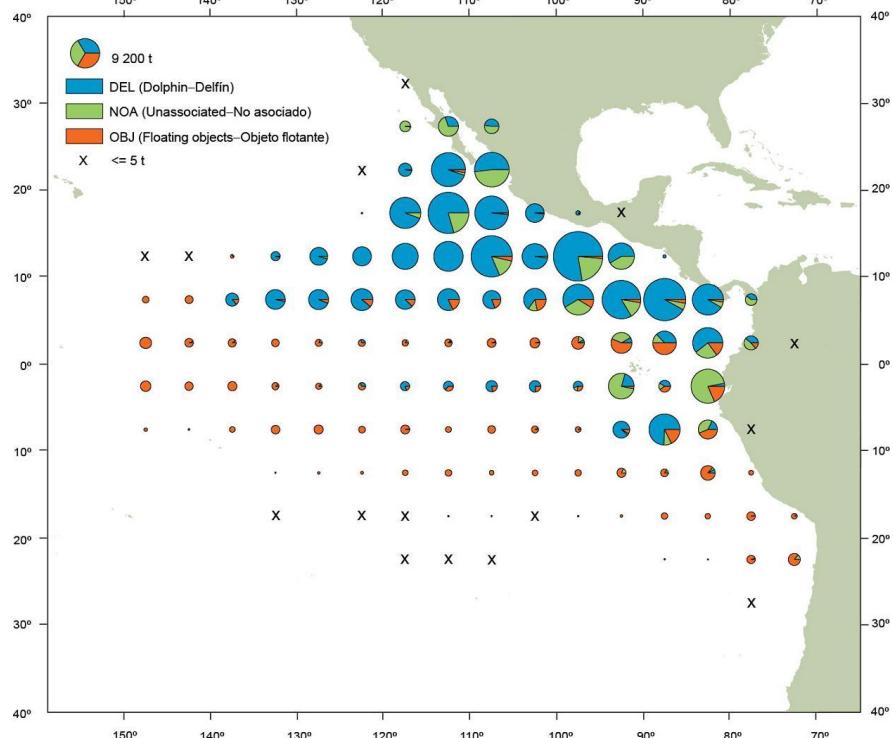

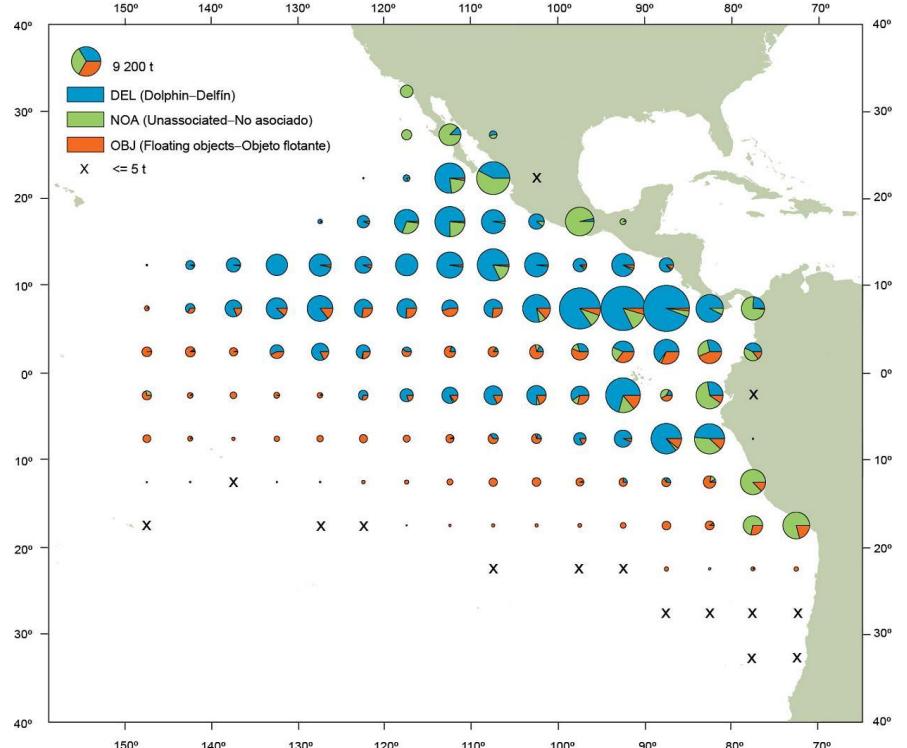

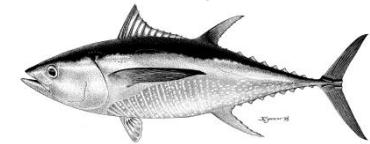

- Surface fisheries
 - Catch, CPUE and size-frequency data updated to include new data for 2010 and revised data for earlier years
- Longline fisheries
 - New or updated longline catch data: French Polynesia (2009), Japan (2008-2010), Korea (2009) and USA (2008-2009)
 - New or updated CPUE data available for Japan (2008-2010)
 - New or updated longline size-frequency data available for Japan (2007-2009)

Total catches

Spatial distribution of PS catches

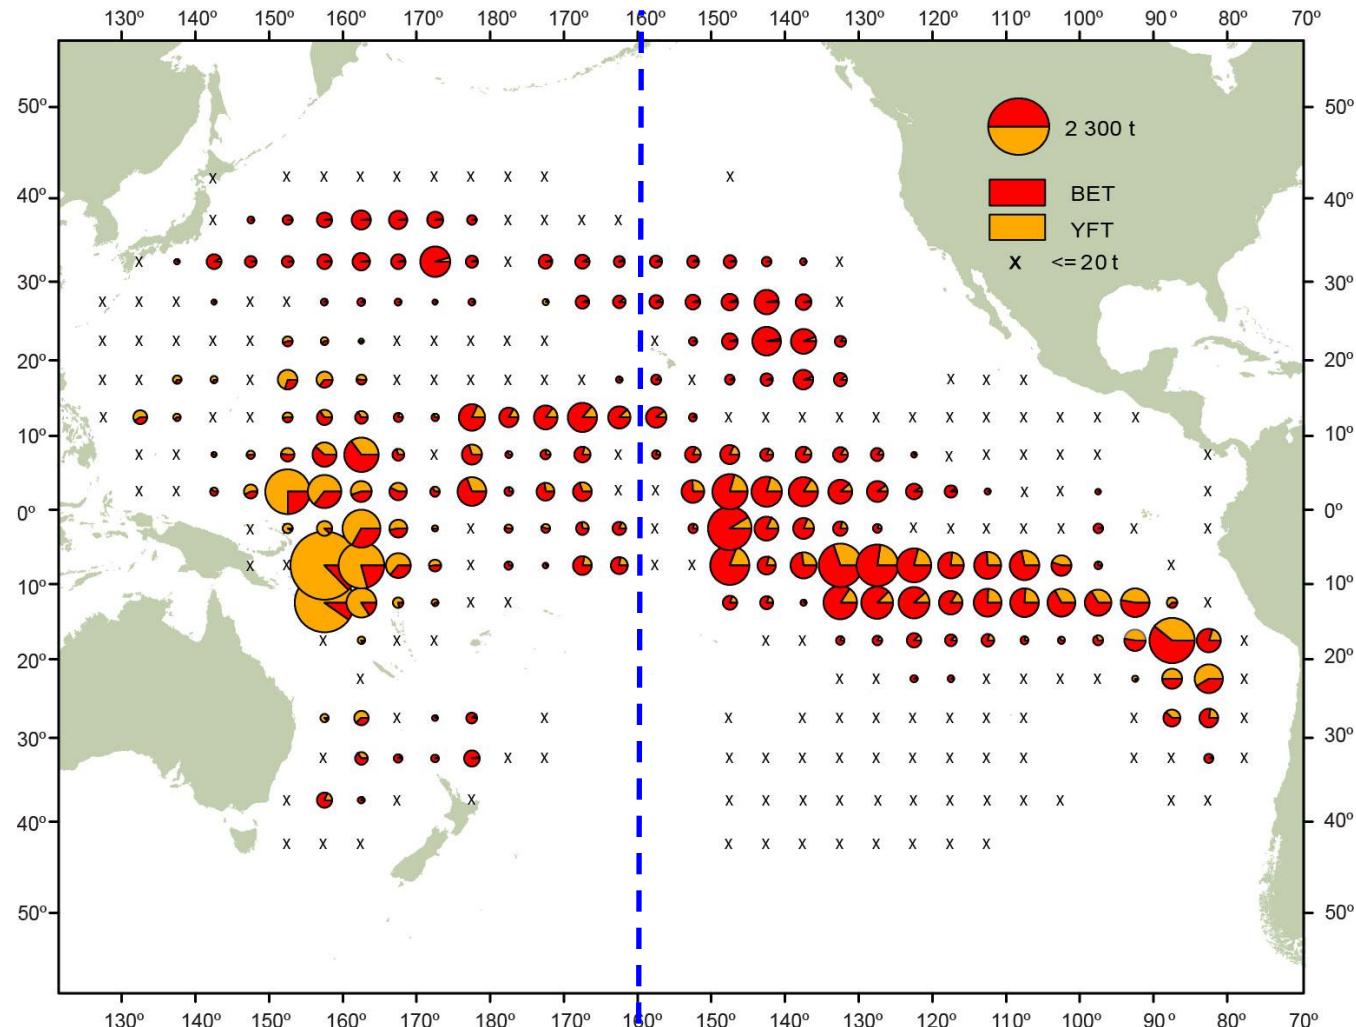

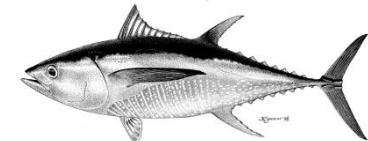

Average annual distribution of YFT PS catches, 2005-2009

Annual distribution of YFT PS catches, 2010

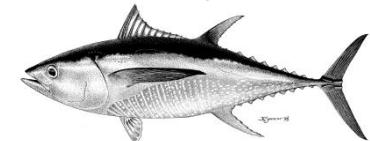

Spatial distribution of LL catches

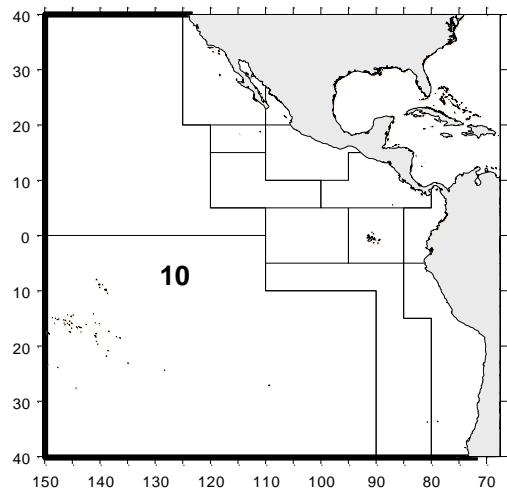

Average annual LL catch, 2005-2009

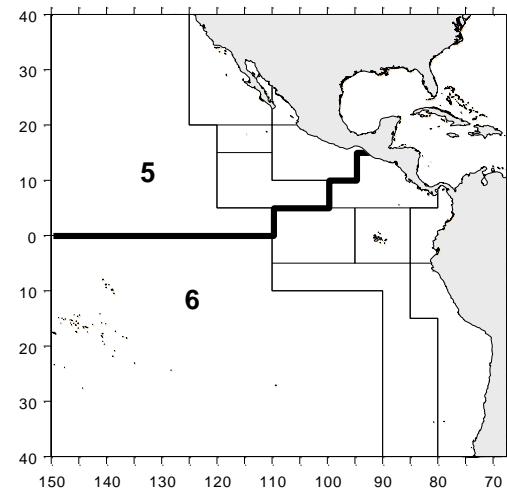

YFT fishery definitions

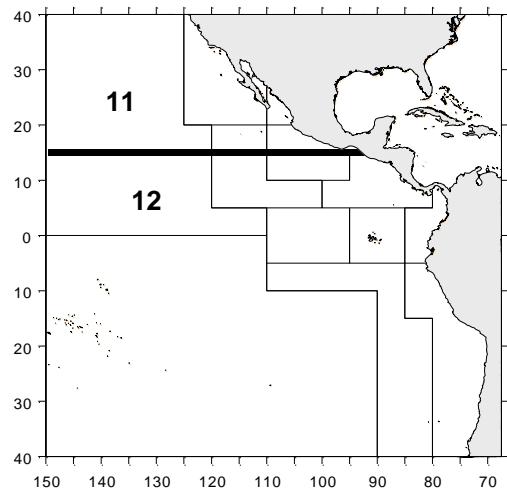

Baitboat

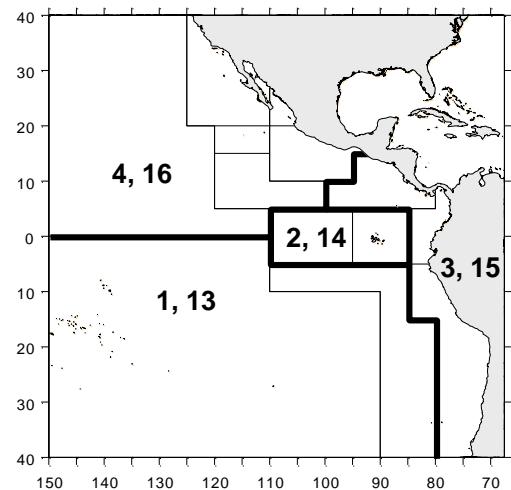

Unassociated

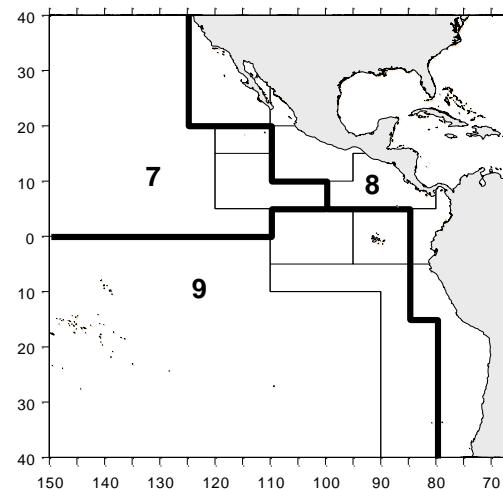

Longline

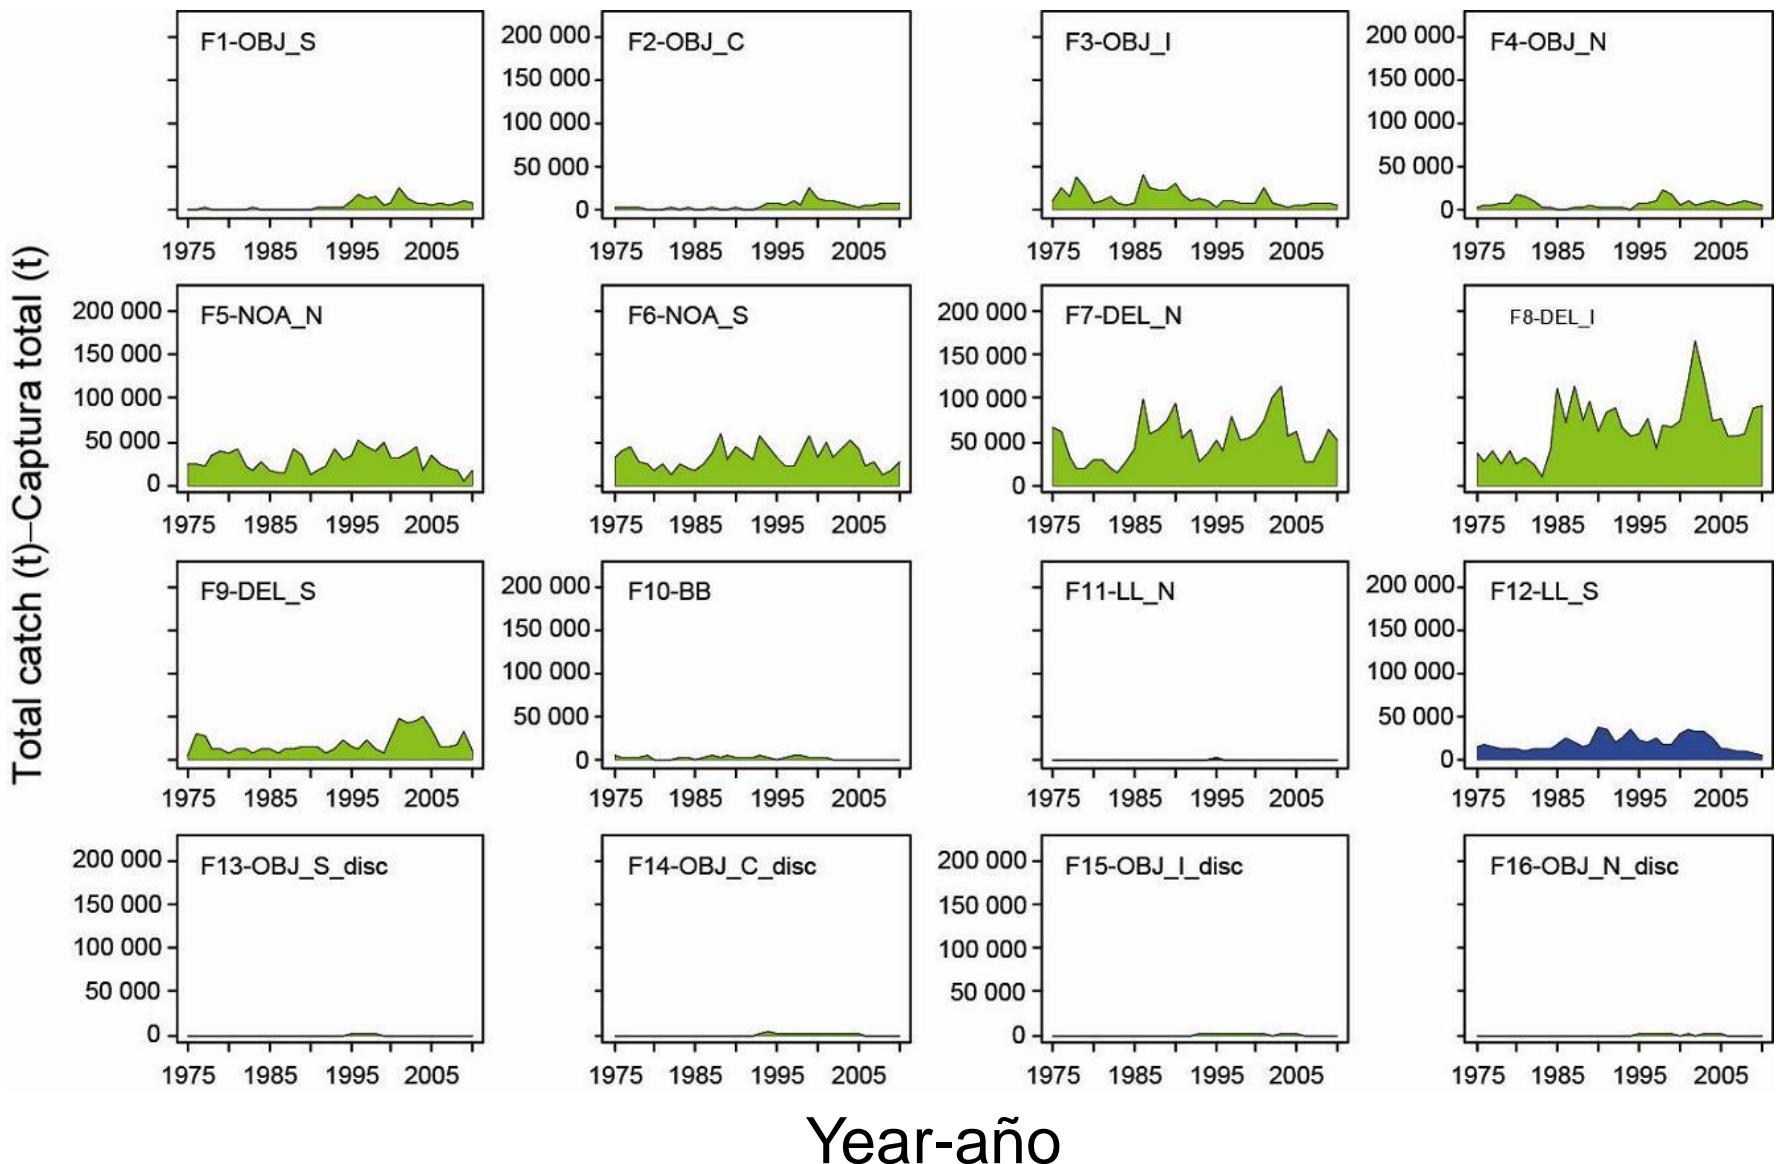

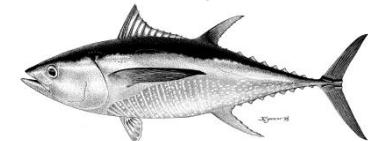

Floating Objects

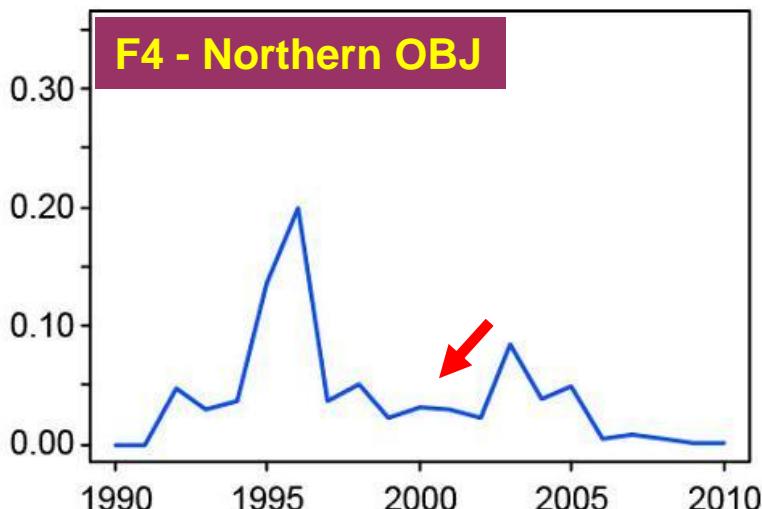

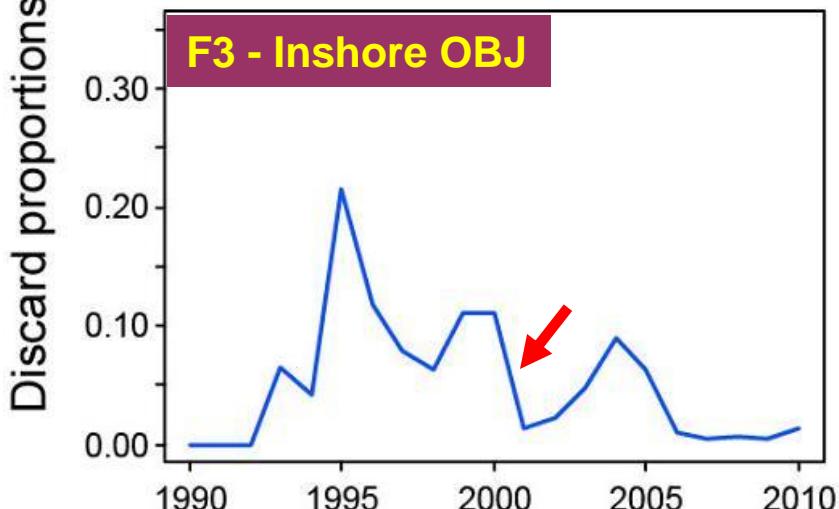

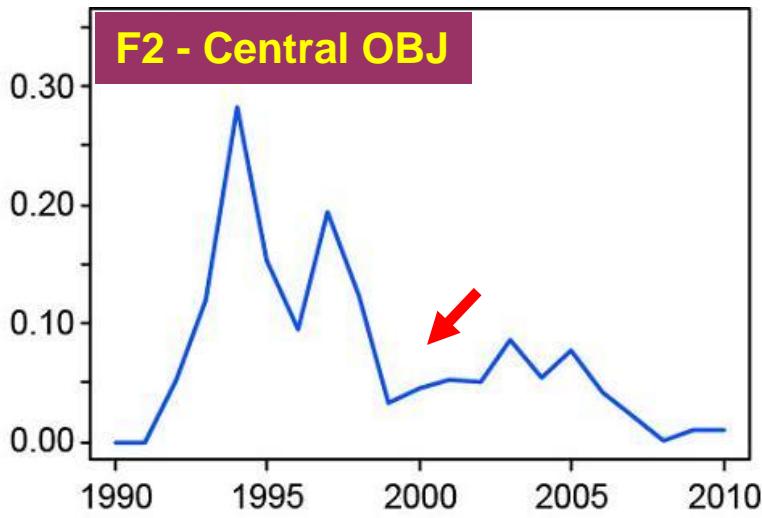

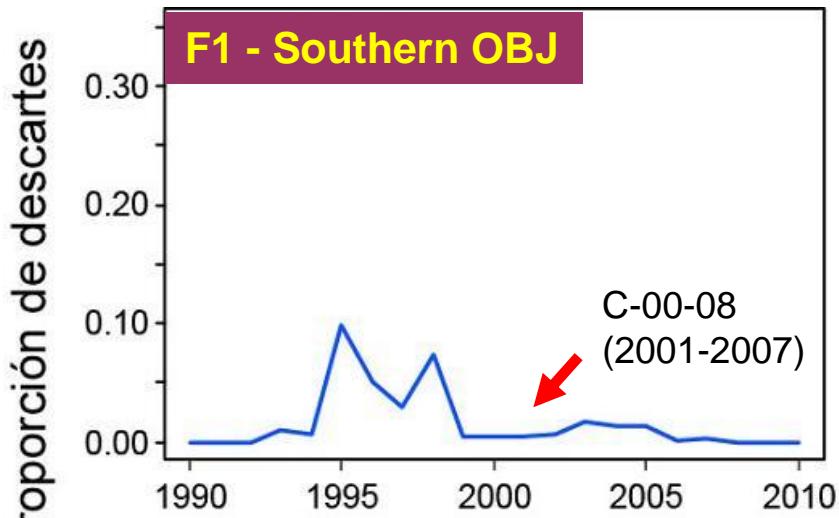

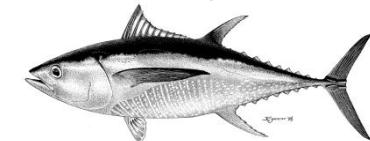

Dolphin

Annual catches by fishery

Large

Medium

Small

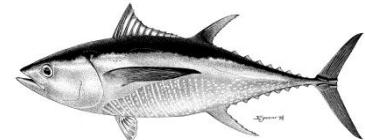

Model assumptions (base case)

- Movement and stock structure
- Biology (growth, natural mortality and maturity)
- Stock-recruitment relationship (S-R)

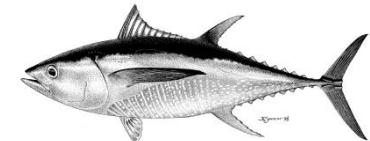

YFT stock structure

- Minimal net movement of fish between the EPO and WCPO
- Single stock of YFT in EPO

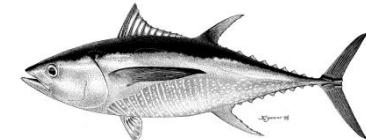

Stock-recruitment relationship

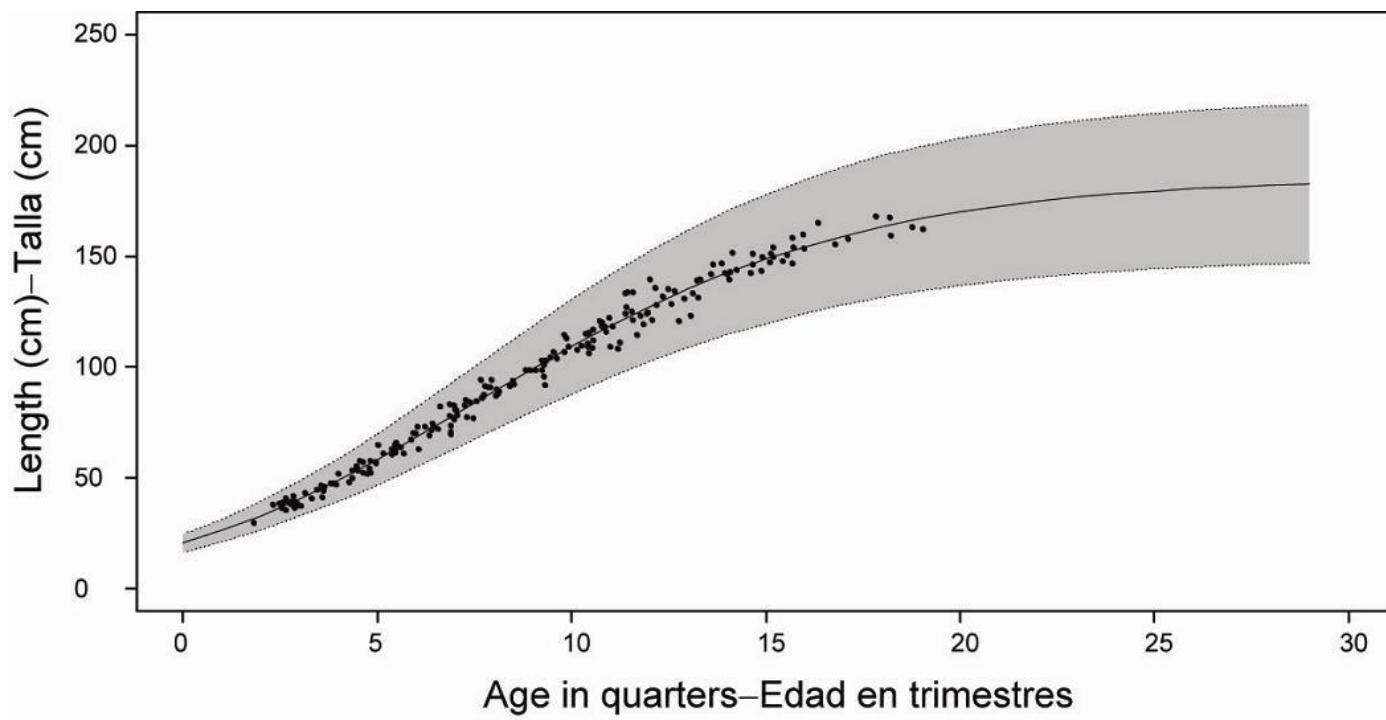

- Beverton-Holt relationship
- No S-R relationship (steepness = 1)
- Sensitivity analysis ([Appendix A](#))
 - Steepness = 0.75
 - Likelihood profile on steepness (0.6, 0.7, 0.8, 0.9, 1.0)

Steepness (h): Fraction of R_0 that is produced if SSB is reduced to 20% of S_0

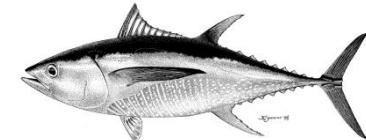

Age and growth

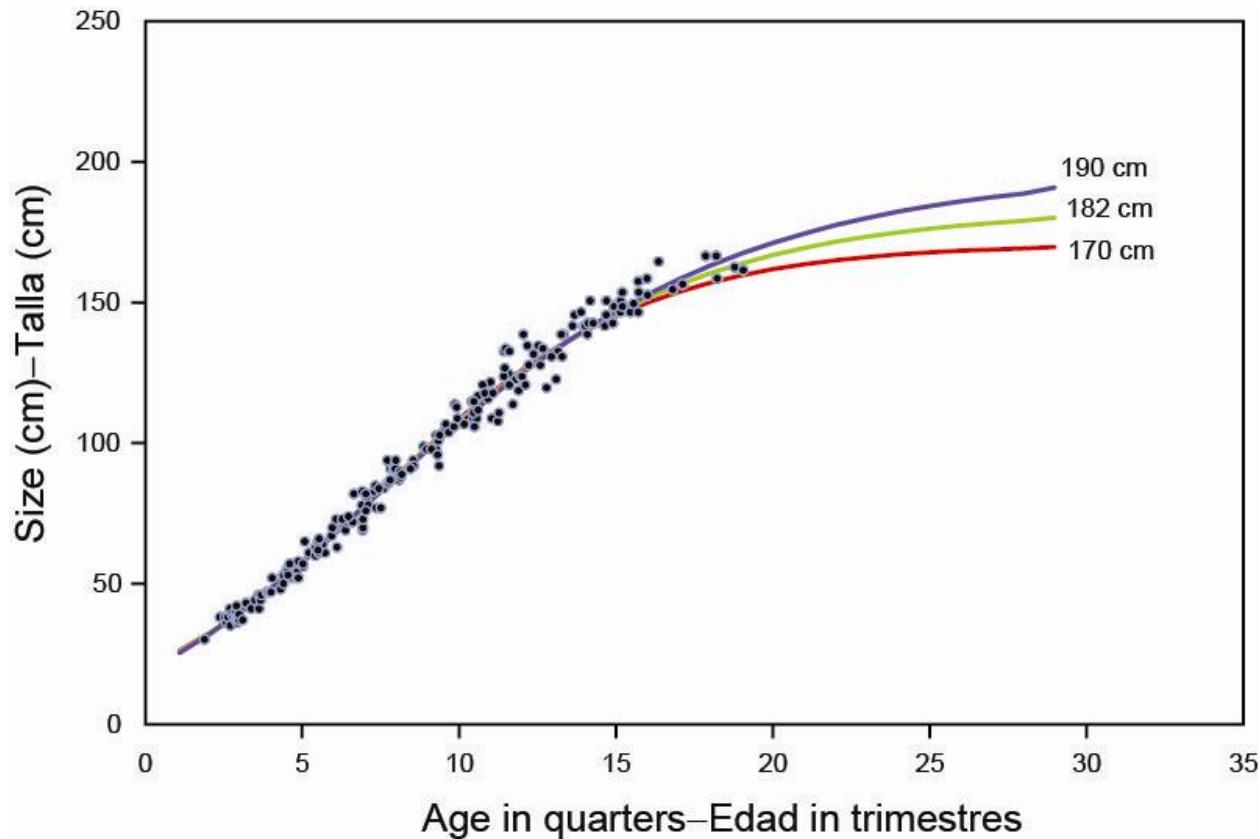

- Richards growth curve
 - Growth parameters fixed (Maunder and Aires-da-Silva, 2009)
 - L_2 fixed at 182.3 cm
 - Variability of length-at-age (LSD) fixed

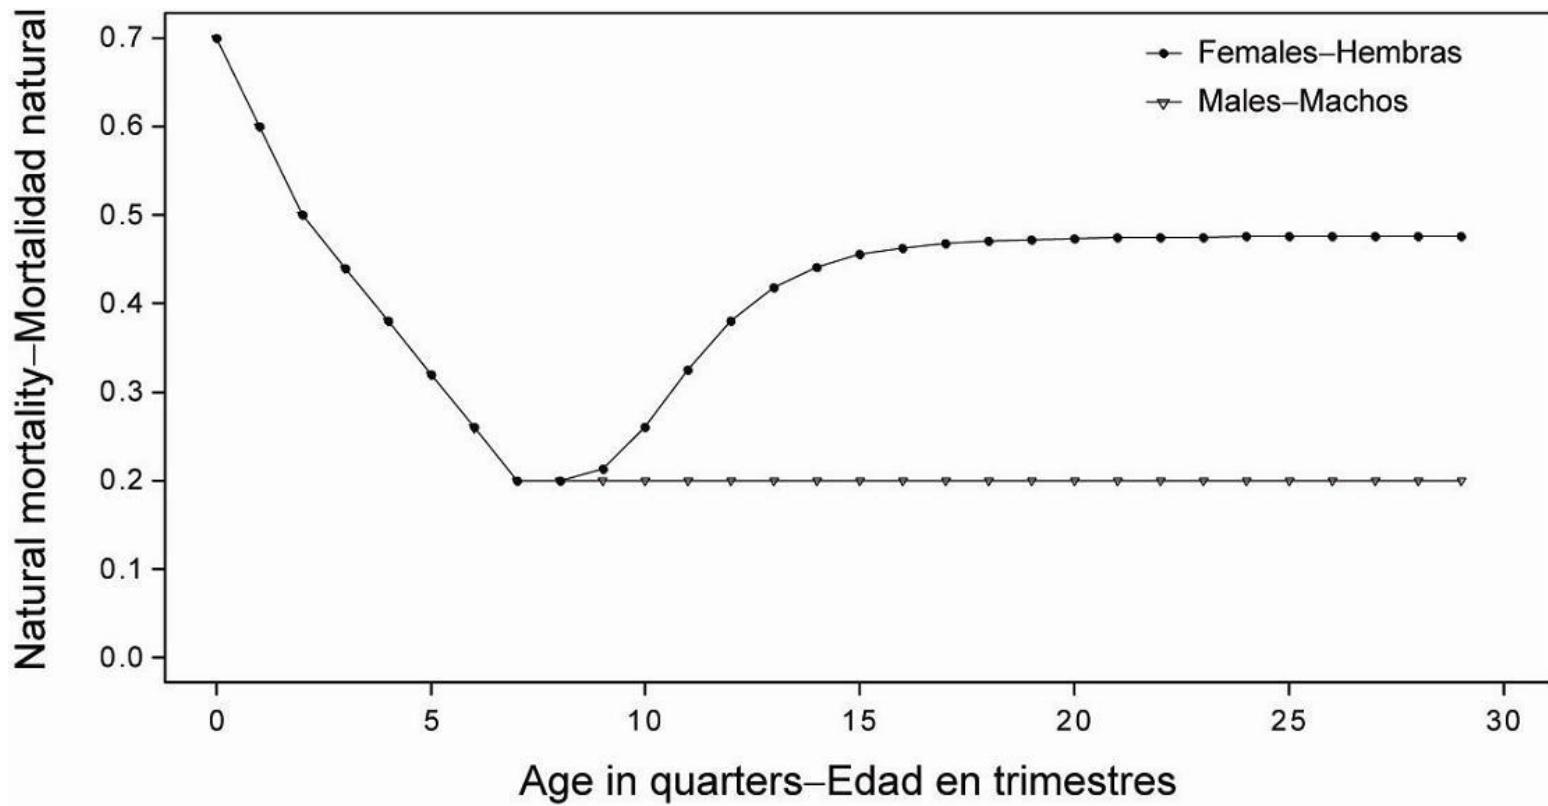

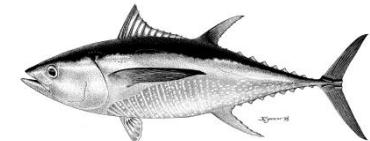

Growth - sensitivities

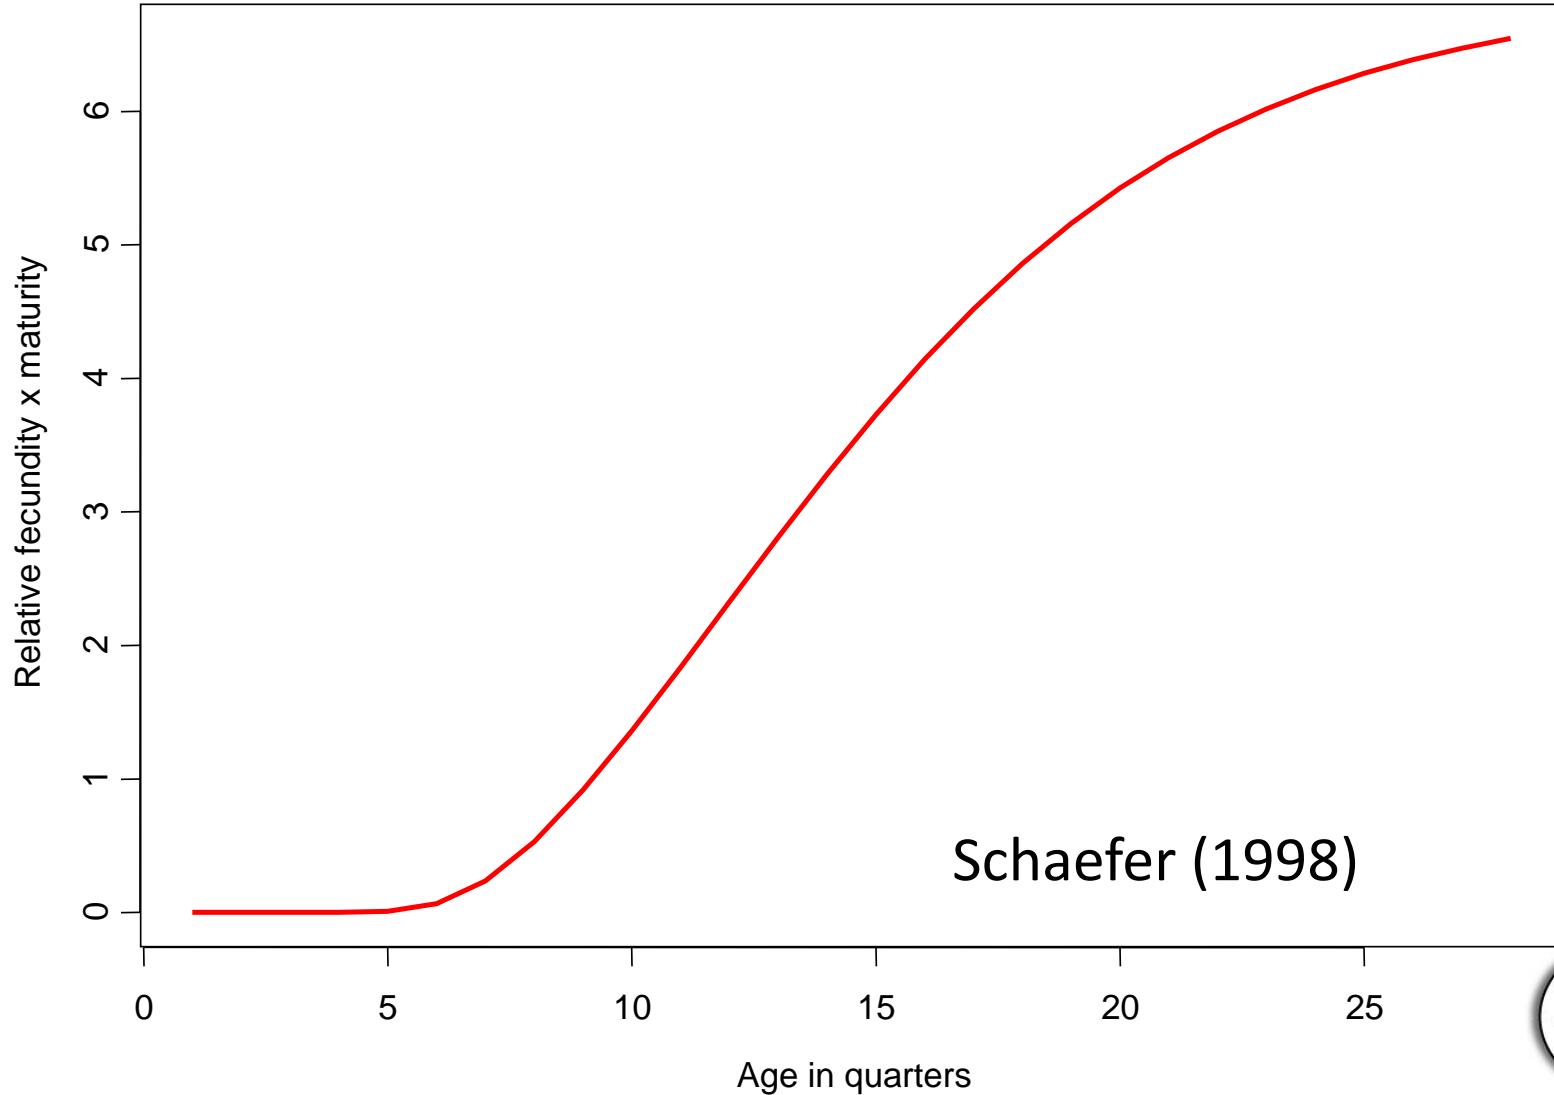

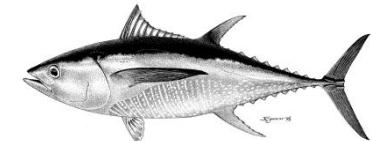

- Sensitivity analysis to fixed value of L_2 (Appendix B)

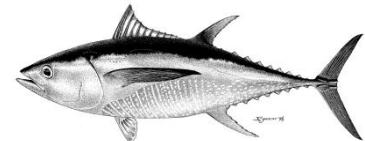

Natural mortality (M)

Relative fecundity

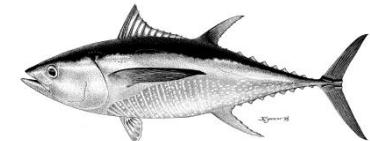

Fixed parameters

- Mean length at age
- Params of a linear model relating the CV of LLA to age
- Sex and age-specific natural mortality-rates (M)
- Sex ratio at age 0 ($=0.5$)
- Age-specific fecundity at age
- CV of LL-S CPUE (CV=0.2), Sensitivity analysis fitting to DEL-N
CPUE as main index (CV=0.2) (Appendix C)
- Selectivity curves for discard fisheries
- Steepness (h) of S-R relationship ($h=1$)

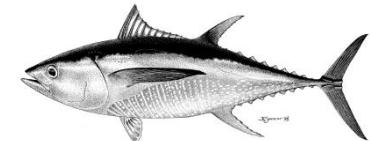

Estimated parameters

- Recruitment in every quarter from 1975 to 2011 (average recruitment and temporal recruitment anomalies)
- Catchability coefficients for the 5 CPUE time series (NOA-N, NOA-S, DEL-N, DEL-I, LL-S)
- CV for 4 CPUE indices (NOA, DEL)
- Selectivity curves for 11 of the 16 fisheries (F9 DEL-S mirrors F12 LL-S)
- Logistic selectivity for LL-S and DEL-S, and dome-shape for all other fisheries (except discards)
- Initial population age-structure

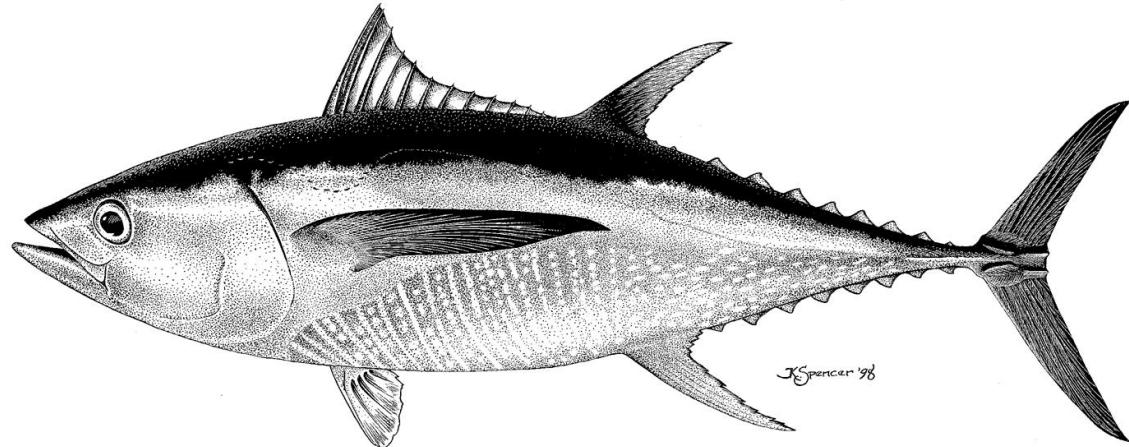

Changes from early assessment (SAC1)

- Fishery definitions: No changes
- Growth modeling: No changes
- Data weighting: the CV of the southern LL-S fishery is fixed (0.2) rather than estimated
- Modeling of selectivity:
 - Sharing of selectivities minimized (DEL-S/LL-S only)
 - No sharing of PL/OBJ-I and LL-N/LL-S

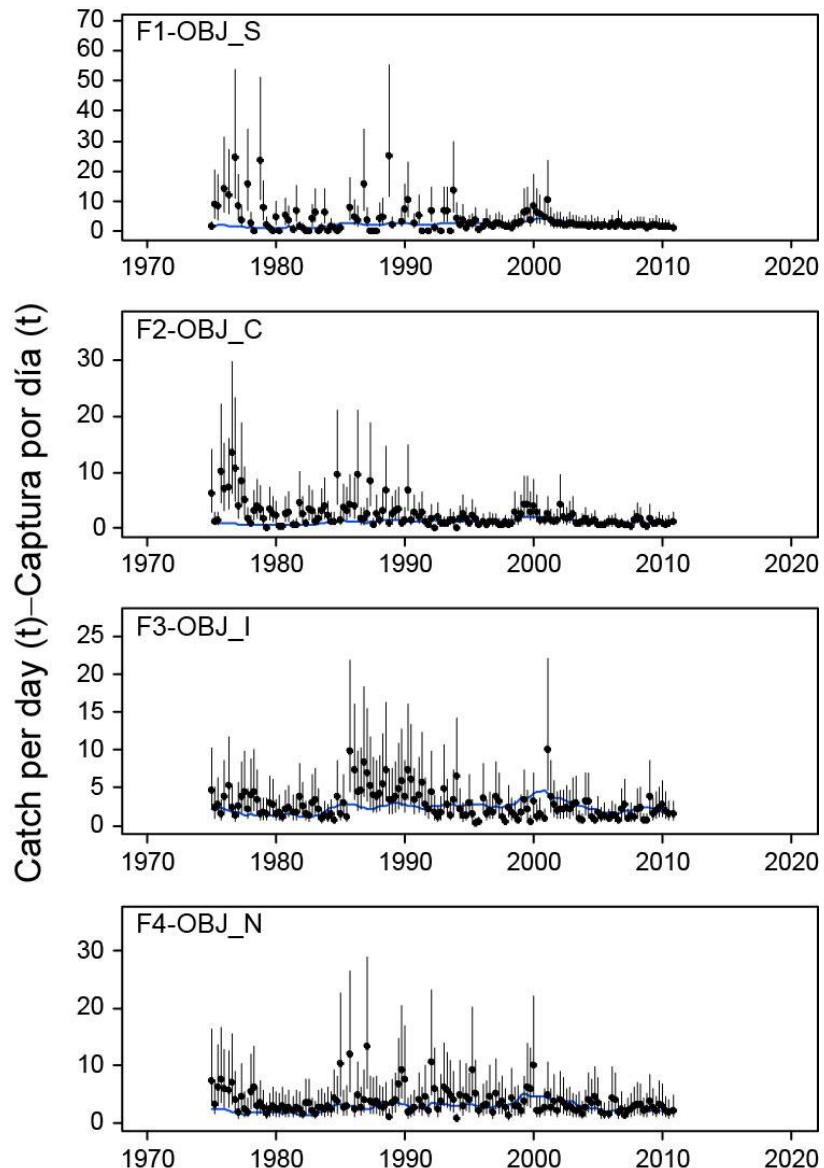

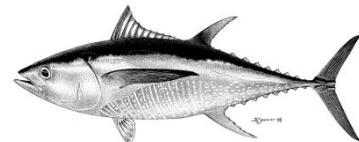

Results (base case)

- Model fits (CPUE and size compositions)
- Fishing mortality
- Selectivity
- Recruitment
- Biomass

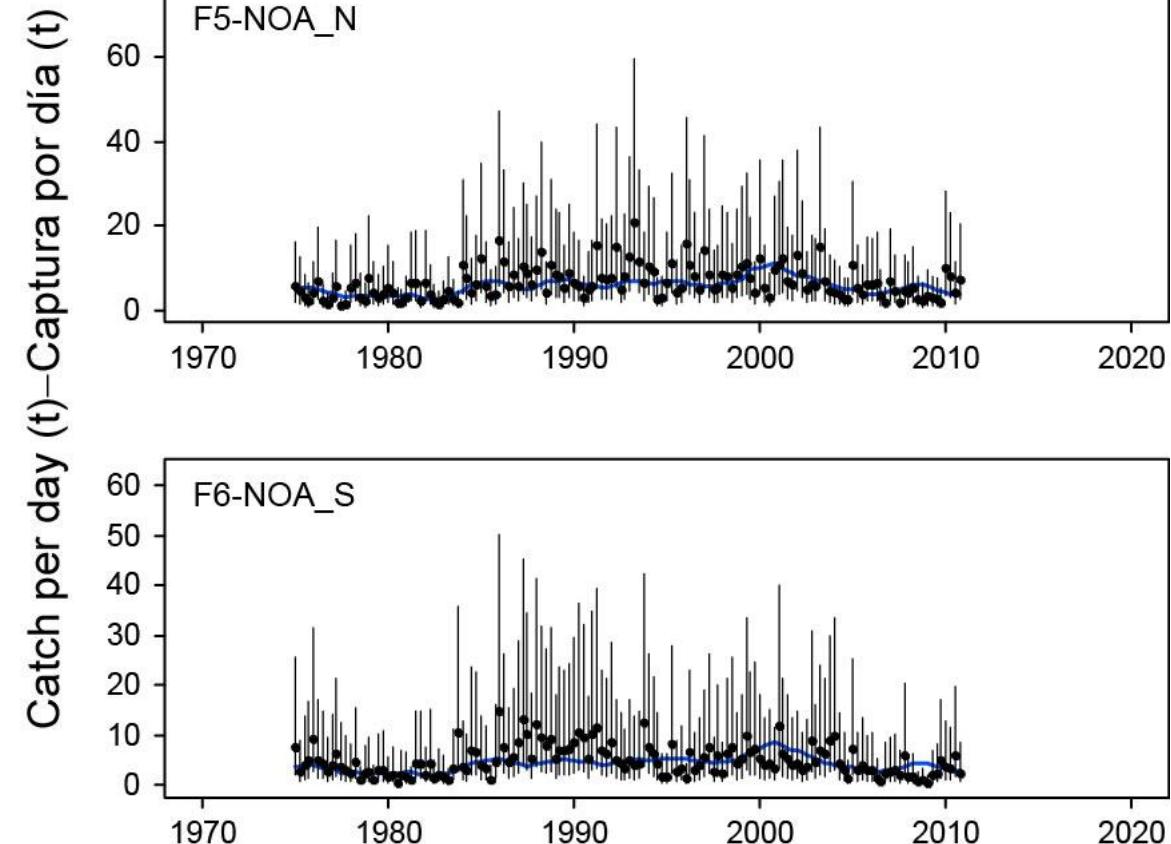

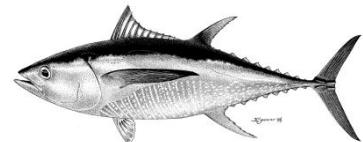

Fit to CPUE – OBJ fisheries

Summary

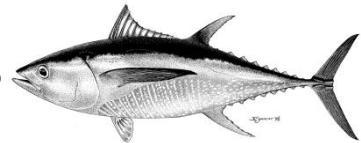

Summary: key results

- The recent **fishing mortality** rates are estimated to be lower than those corresponding to the MSY
- The recent levels of **spawning biomass** are estimated to be below those corresponding to the MSY ($S_{\text{recent}} < S_{\text{MSY}}$)

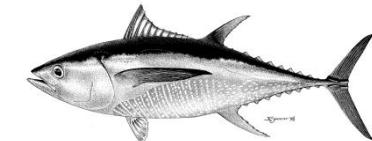

Plausible Sensitivities and Uncertainties

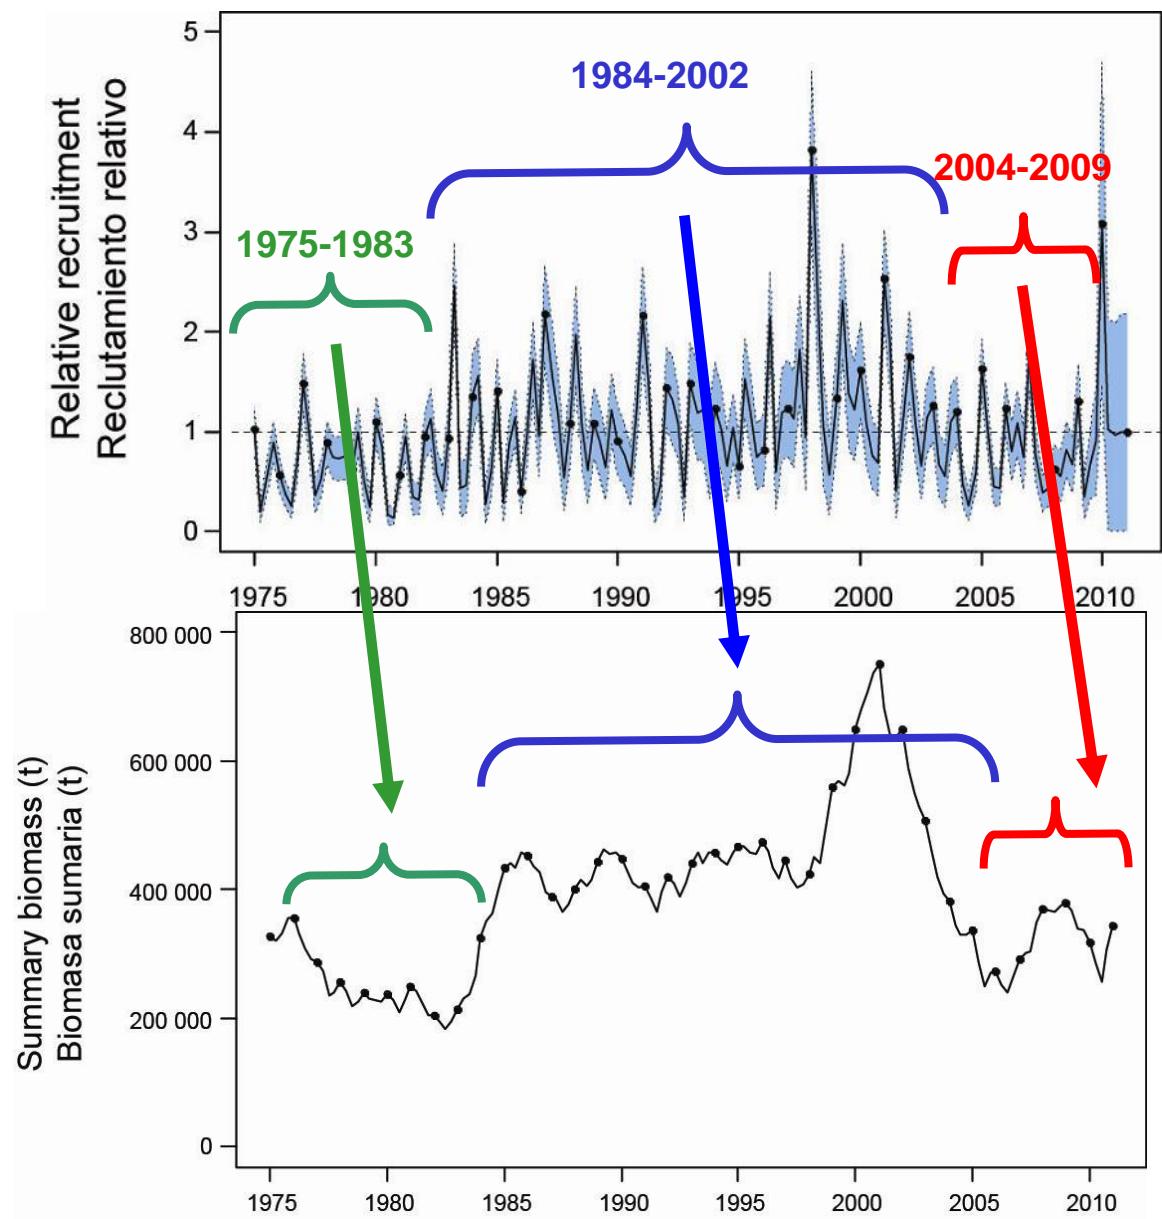

- Results are more **pessimistic** with:
 - The inclusion of a stock-recruitment relationship
 - Higher values of the average size of the oldest fish ($L_2 > 190$ cm)

- Results are more **optimistic** with:
 - Lower values of the average size of the oldest fish ($L_2 < 182$ cm)
 - Fitting to CPUE DEL-N as main index of abundance ($S_{\text{recent}} = S_{\text{MSY}}$)

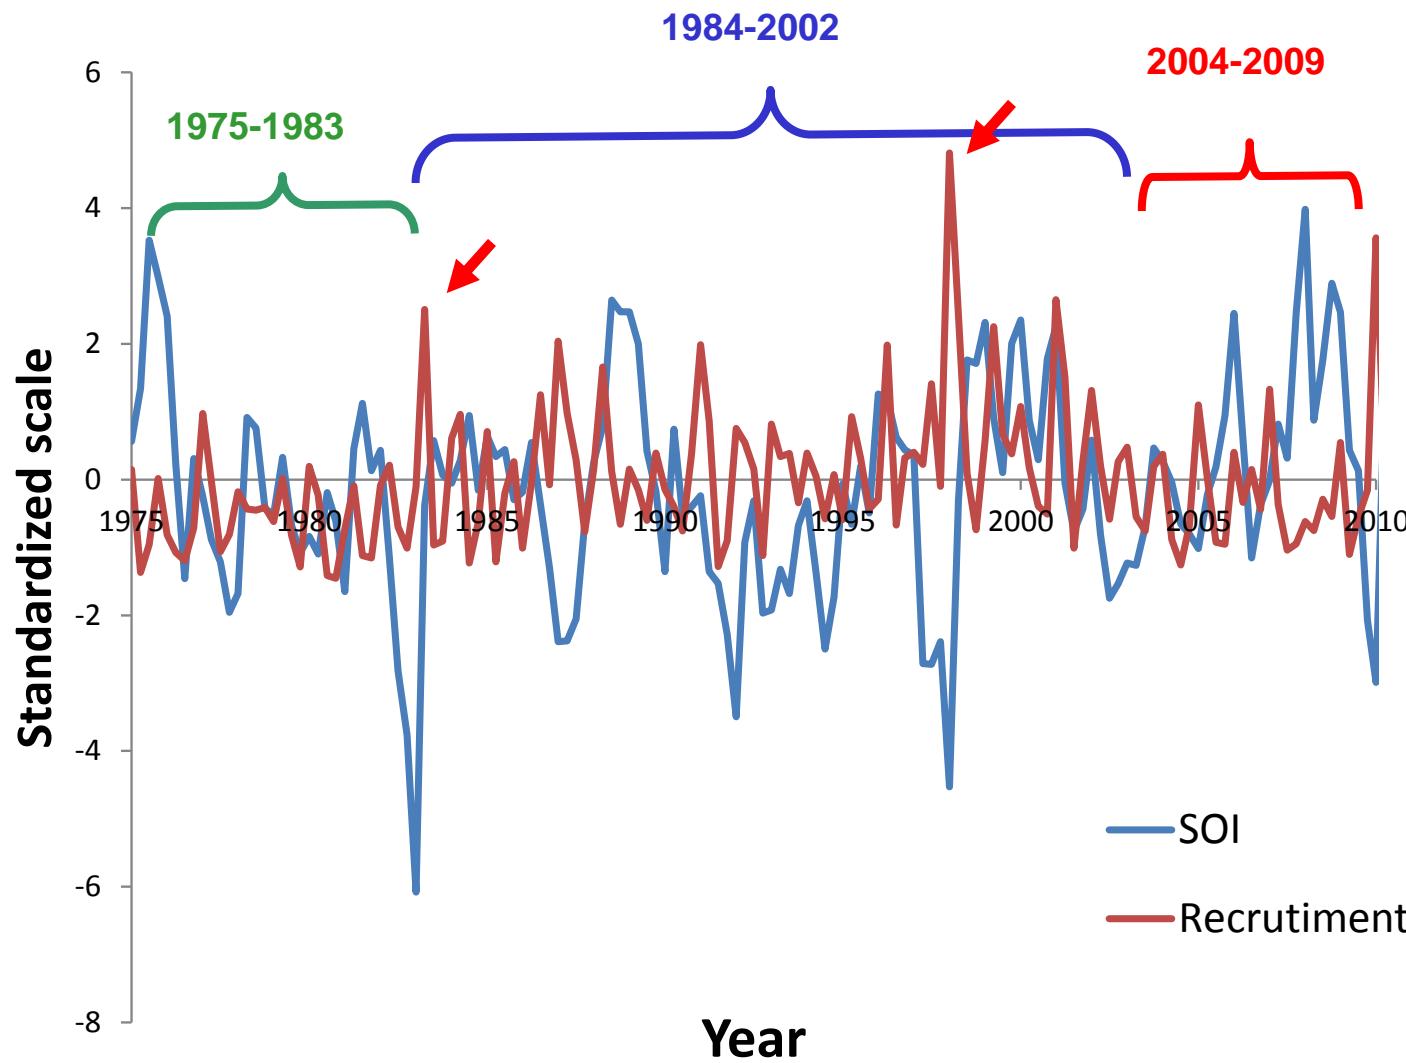

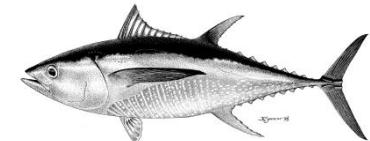

Summary: key results (cont.)

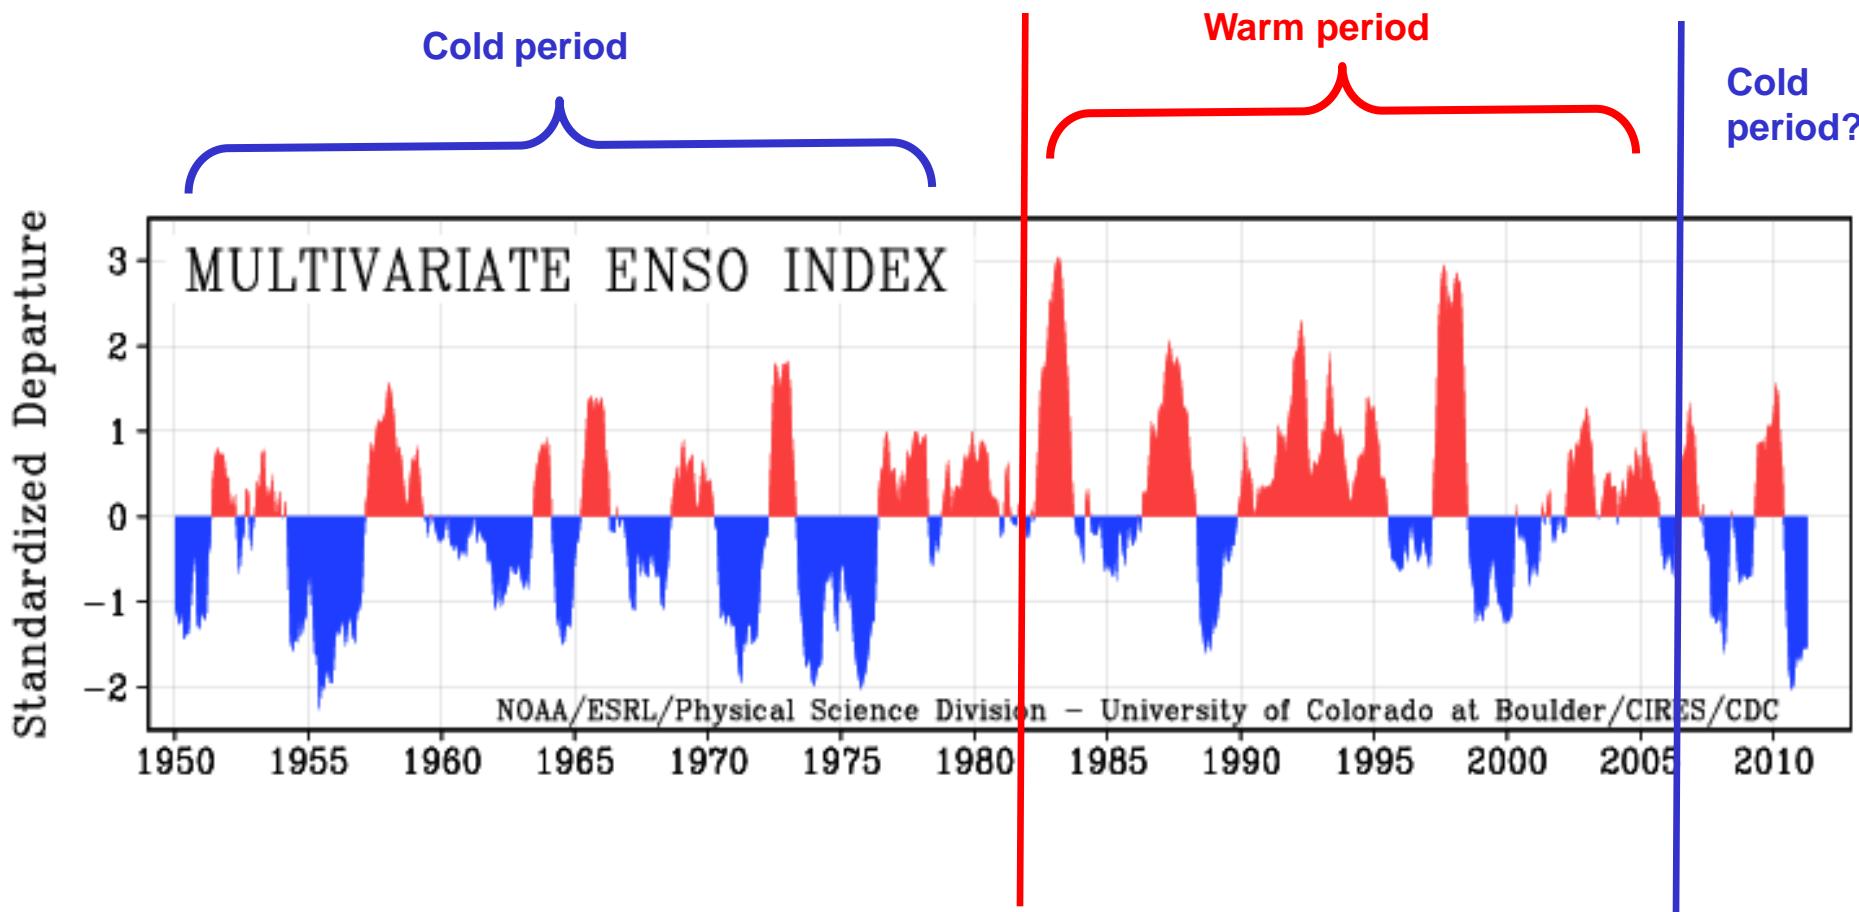

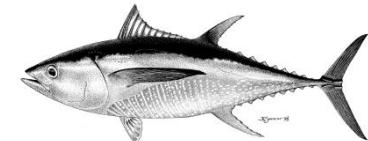

- There population may have recently switched from a high to a lower productivity regime

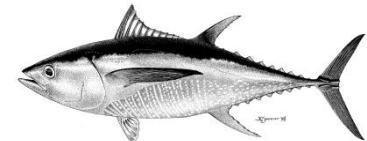

SOI - El Niño / La Niña?

ENSO

Future directions

- Alternative assumptions on stock structure (LL fishery definitions)
- Time-variant selectivity for PS fisheries
- More robust selectivity curves
- Determine appropriate weighting of the different data sets
