Operating models and estimation model for EPO bigeye tuna MSE

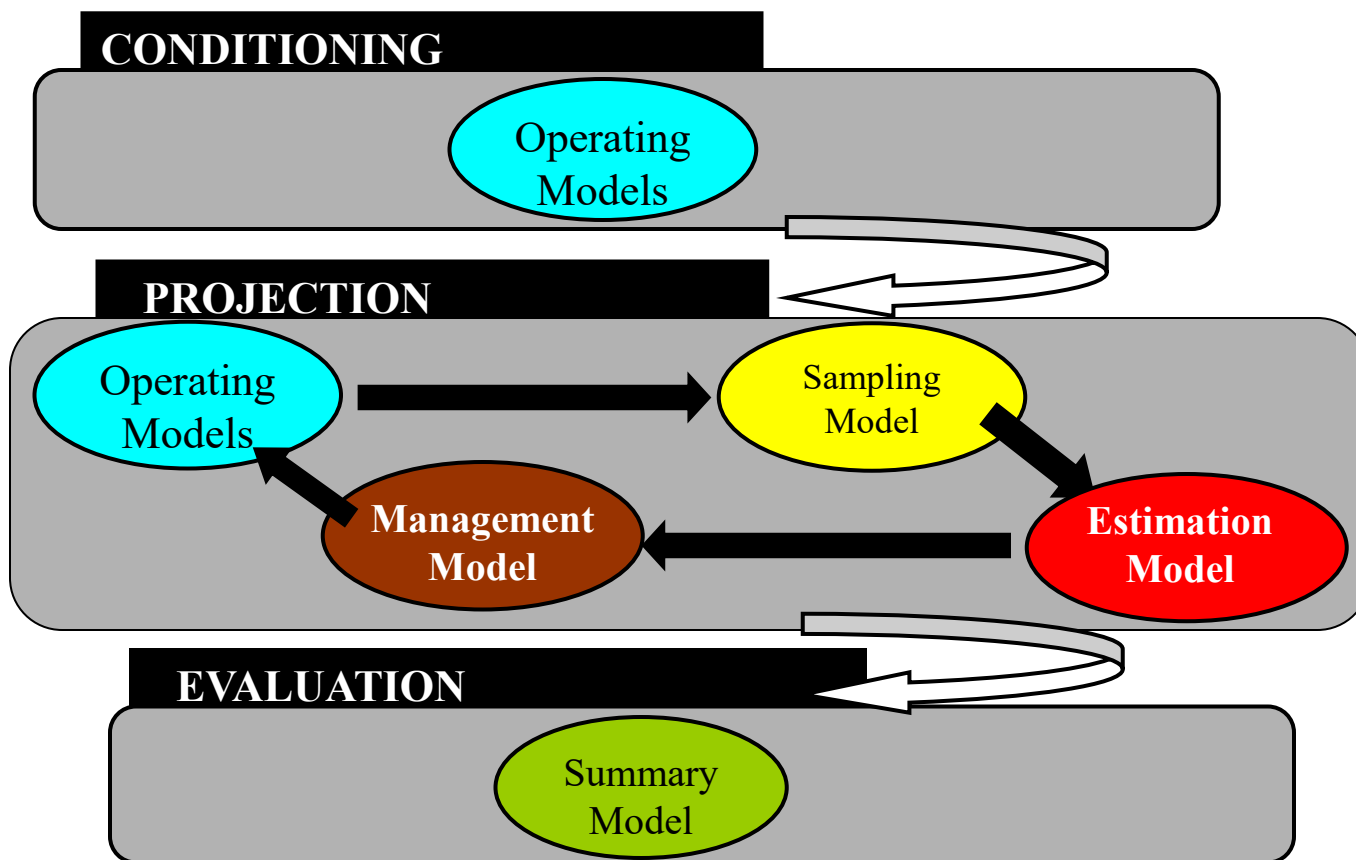

Juan L. Valero, Mark N. Maunder, Haikun Xu, Alexandre Aires-da-Silva

4th IATTC Tropical Tuna MSE Workshop, by videoconference, March 20-21, 2025

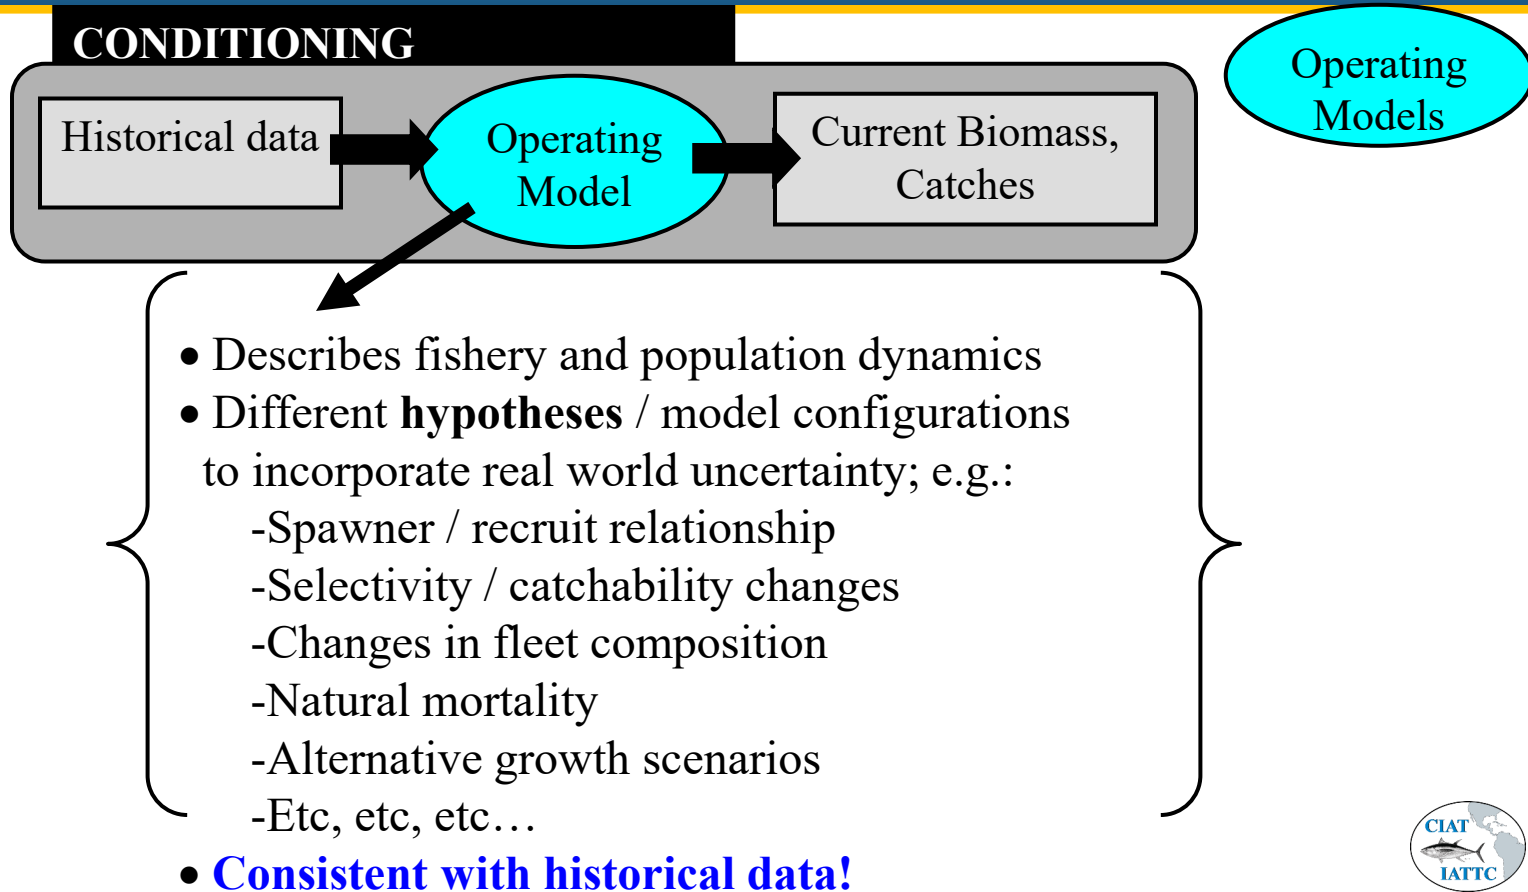

# Evaluación de Estrategias de Ordenación: Componentes

## Management Strategy Evaluation: Components

# Operating Models and Conditioning

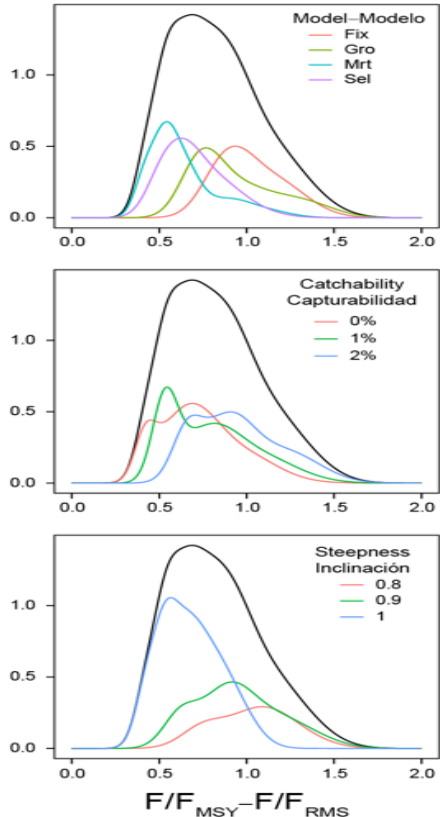

# OMs from 2024 BET reference models

Operating Models

## New Operating Models 2024 BET Assessment

Spawning biomass ratio - Cociente de biomasa reproductora

# Sample design for OMs from BET reference models

## Reference set OMs

Operating  
Models

**Level 1 hypothesis:**

- 1) Model Fix,
- 2) Gro (estimate growth),
- 3) Sel (all selectivities dome-shape),
- 4) Mrt (Natural mortality  $M$  values for adult male 0.1, 0.12, 0.125, 0.13)

**Level 2 hypothesis:** Annual increase in longline catchability (effort creep) **0%**, 1%, **2%**

**Level 3 hypothesis:** Steepness of the Beverton-Holt stock-recruit relationship ( $h$ ) of **1.0**, 0.9, **0.8**

- The combination of the three hypothesis yields  $4 \times 3 \times 3 =$  **36 models**
- The combination of the three hypothesis yields  $4 \times 2 \times 2 =$  **16 models**
- **Models will be given equal weights in the MSE**

# Sample design for OMs from BET reference models

## Robustness set OMs

Operating Models

Alternative Models with previous benchmark Natural Mortality, Growth, Selectivity assumptions

# Sampling model

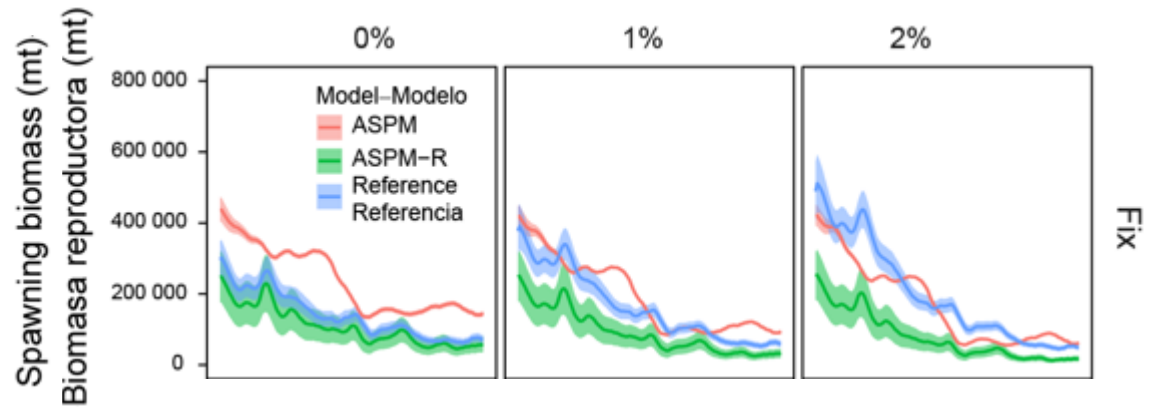

## Sampling Model

- Define how data (e.g., catches, size compositions, CPUE) are collected from the simulated “true” population (including observation uncertainty, the effect of measurement error and bias).
- The bootstrap functionality of Stock Synthesis is used to generate the observed data.
  - Standardized Japanese longline index of abundance and total catches

# EM for BET (simpler assessment model)

- ASPM-Rdevs in *Stock Synthesis*

Estimation Model
