

# Yellowfin Tuna Assessment Update 1975-2009

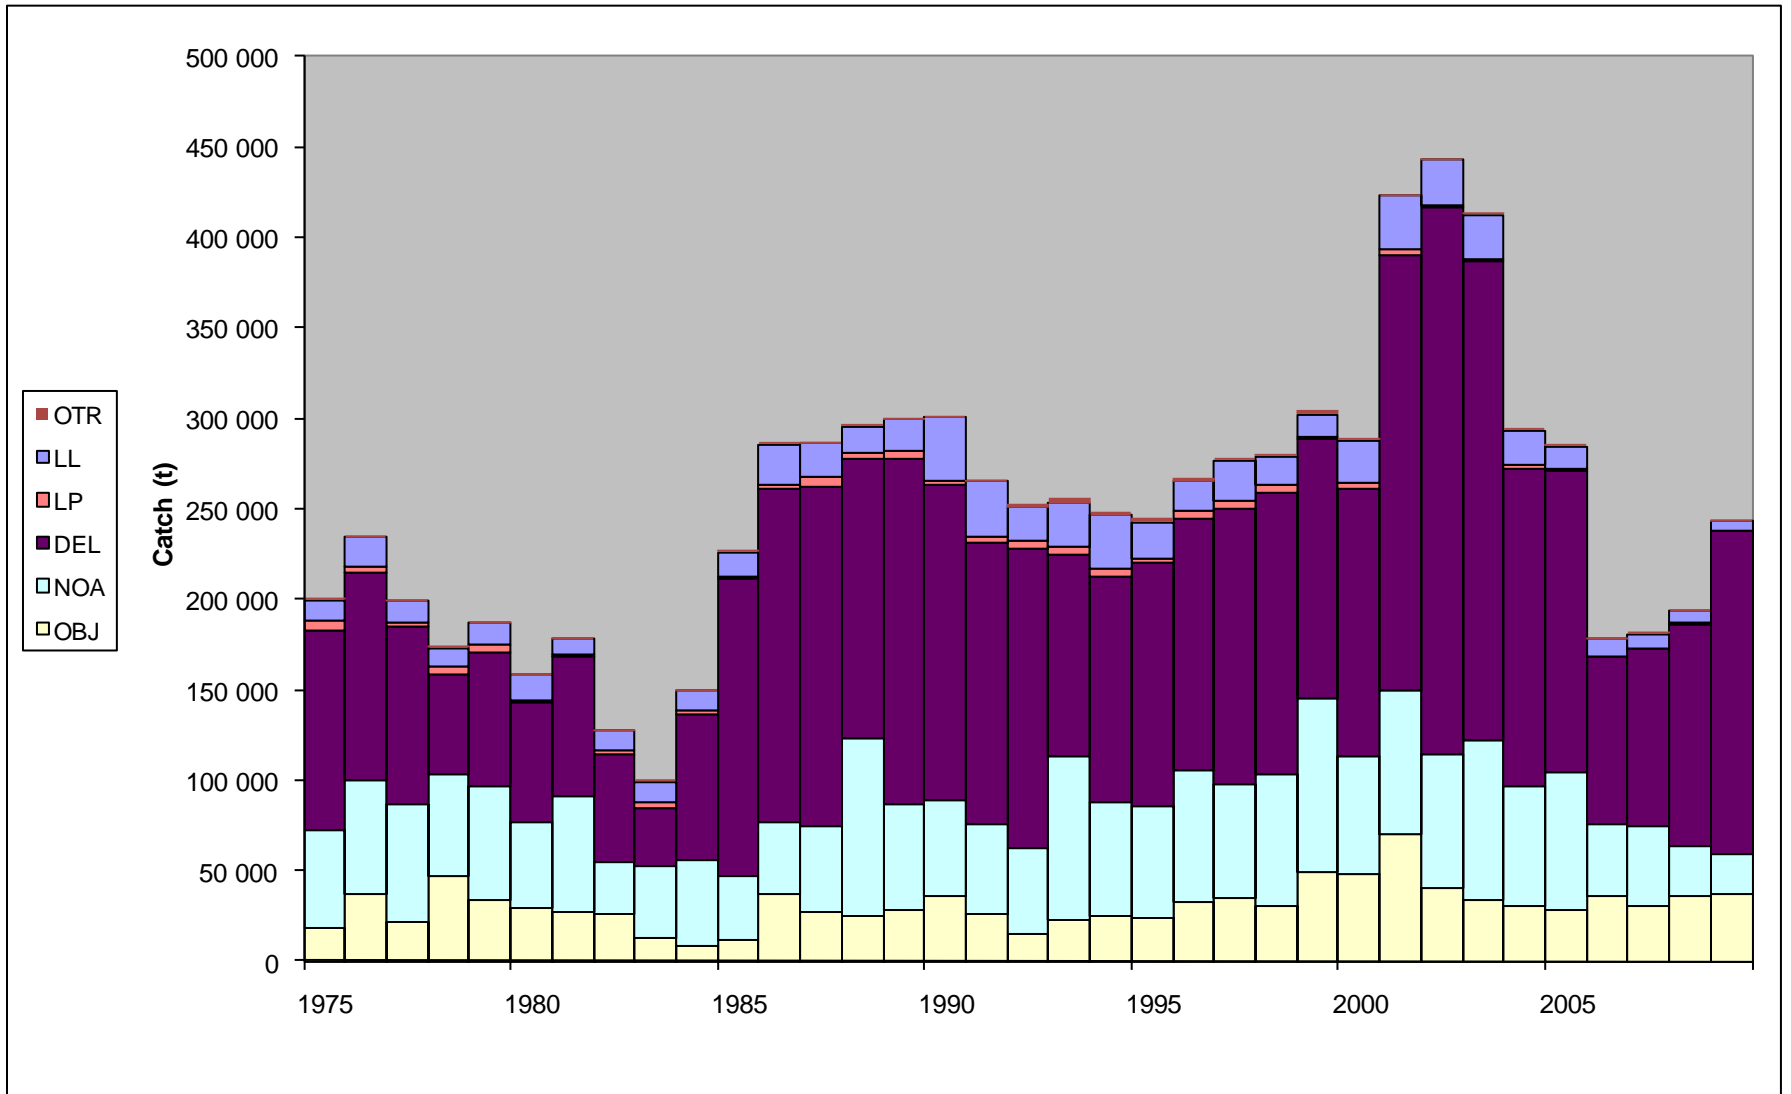

# Methodology

- Stock Synthesis
- Similar to BET assessment
- Only update data
- Also conduct stock-recruitment sensitivity

# Major Changes

- Catch, effort, and length composition data for the surface fisheries have been updated to include new data for 2009 and revised data for earlier years.
- New or updated longline catch data are available for China (2008), Chinese Taipei (2006-2009), French Polynesia (2008), Korea (2007-2008) and the United States (2007-2008).
- No new longline CPUE or length composition data

# Catch

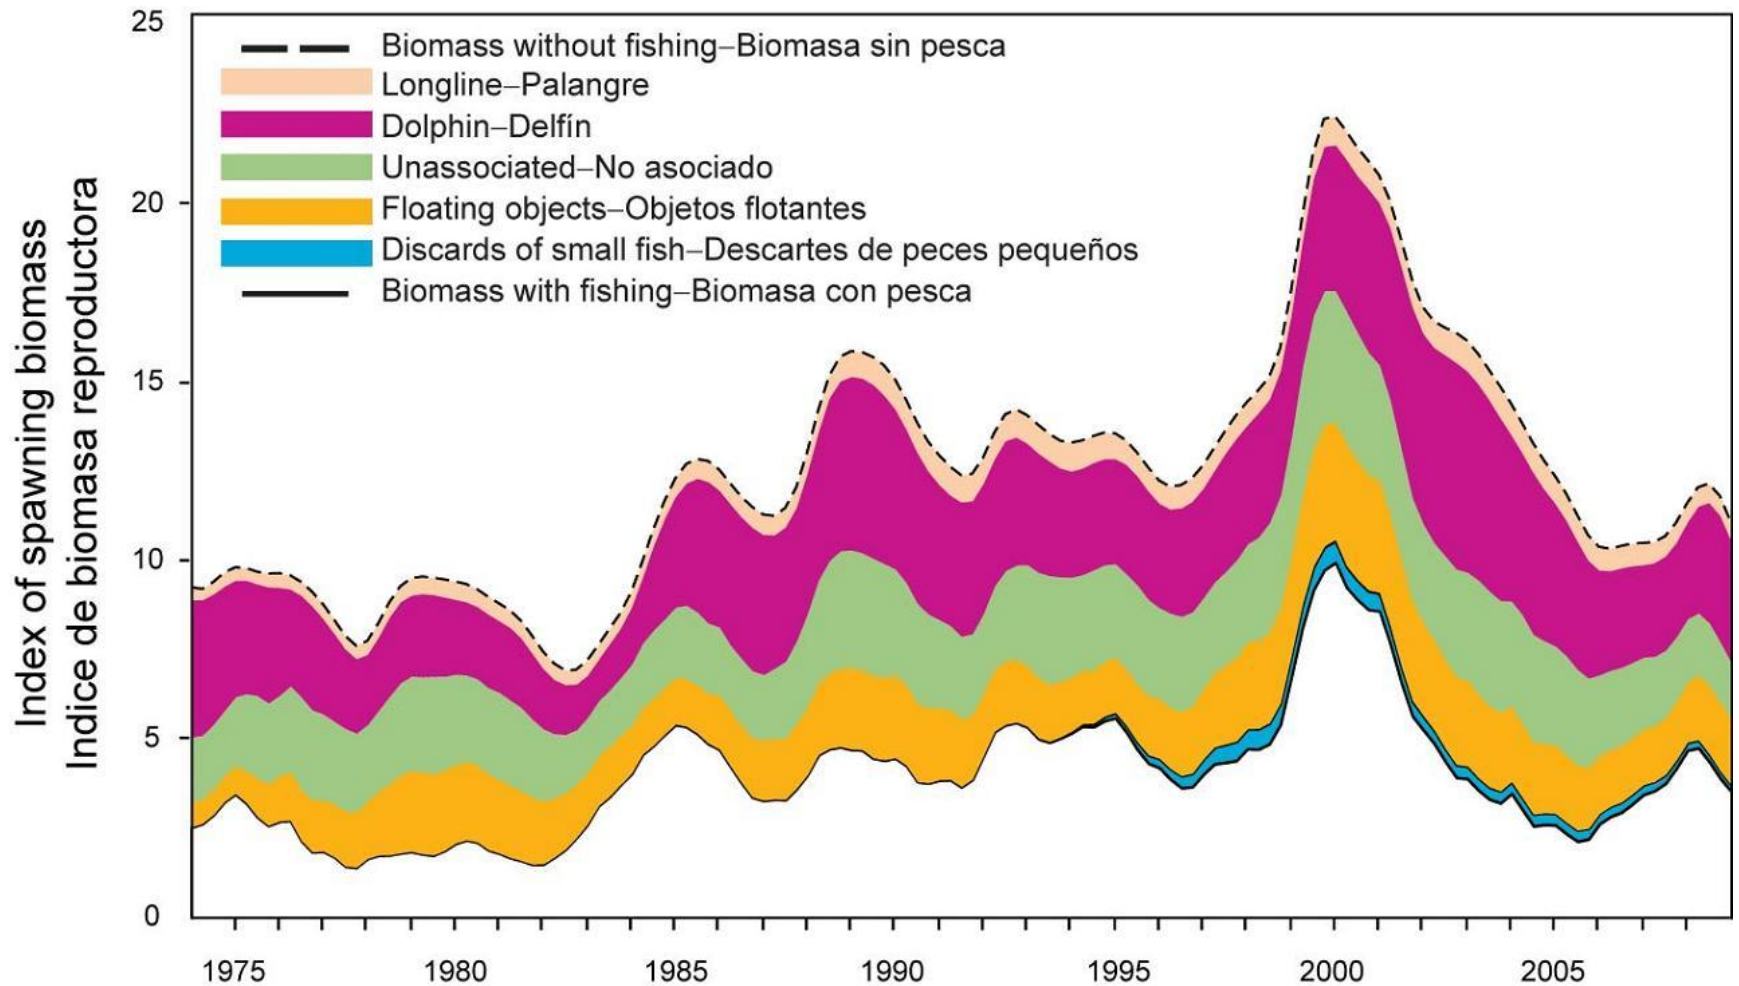

# Recruitment

# Fishing mortality

# Fishery impact

# Spawning biomass ratio

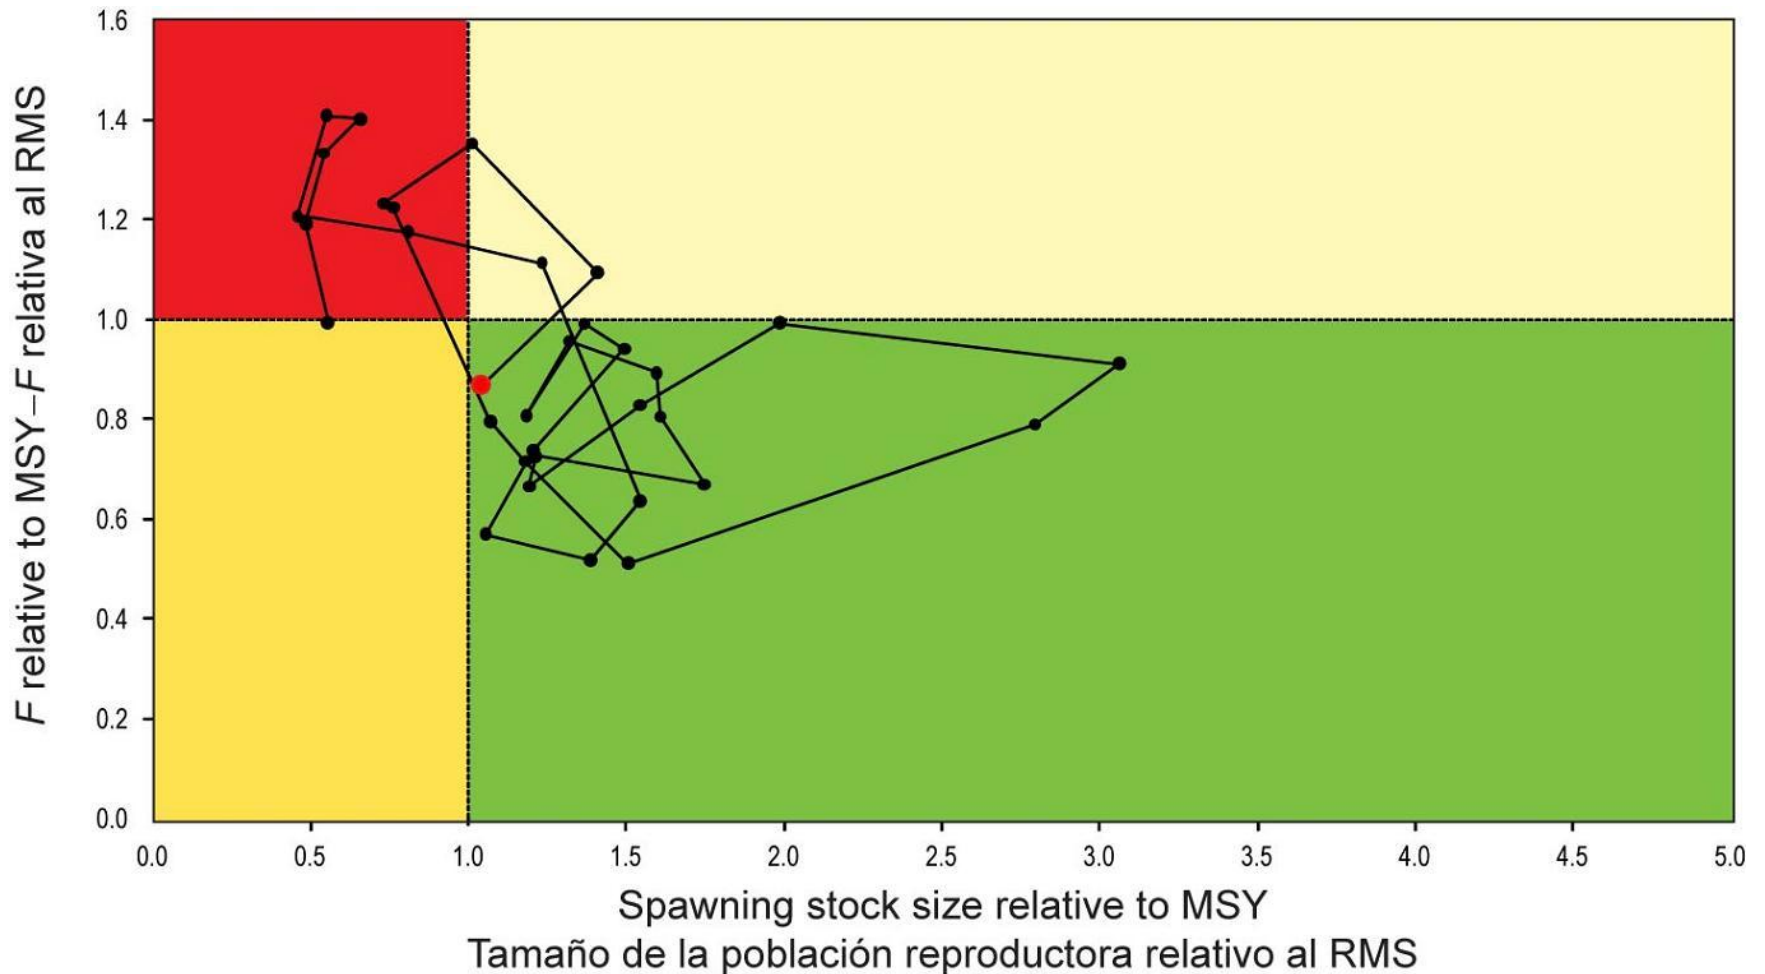

# Management quantities

	Base case – Caso base	$h = 0.75$
MSY–RMS	264,967	289,896
$B_{\text{MSY}} - B_{\text{RMS}}$	357,780	555,182
$S_{\text{MSY}} - S_{\text{RMS}}$	3,367	5,974
$C_{\text{recent}}/\text{MSY} - C_{\text{reciente}}/\text{RMS}$	0.94	0.86
$B_{\text{recent}}/B_{\text{MSY}} - B_{\text{reciente}}/B_{\text{RMS}}$	1.10	0.71
$S_{\text{recent}}/S_{\text{MSY}} - S_{\text{reciente}}/S_{\text{RMS}}$	1.05	0.59
$S_{\text{MSY}}/S_{F=0} - S_{\text{RMS}}/S_{F=0}$	0.27	0.35
$F$ multiplier—Multiplicador de $F$	1.33	0.69

# Management phase plot

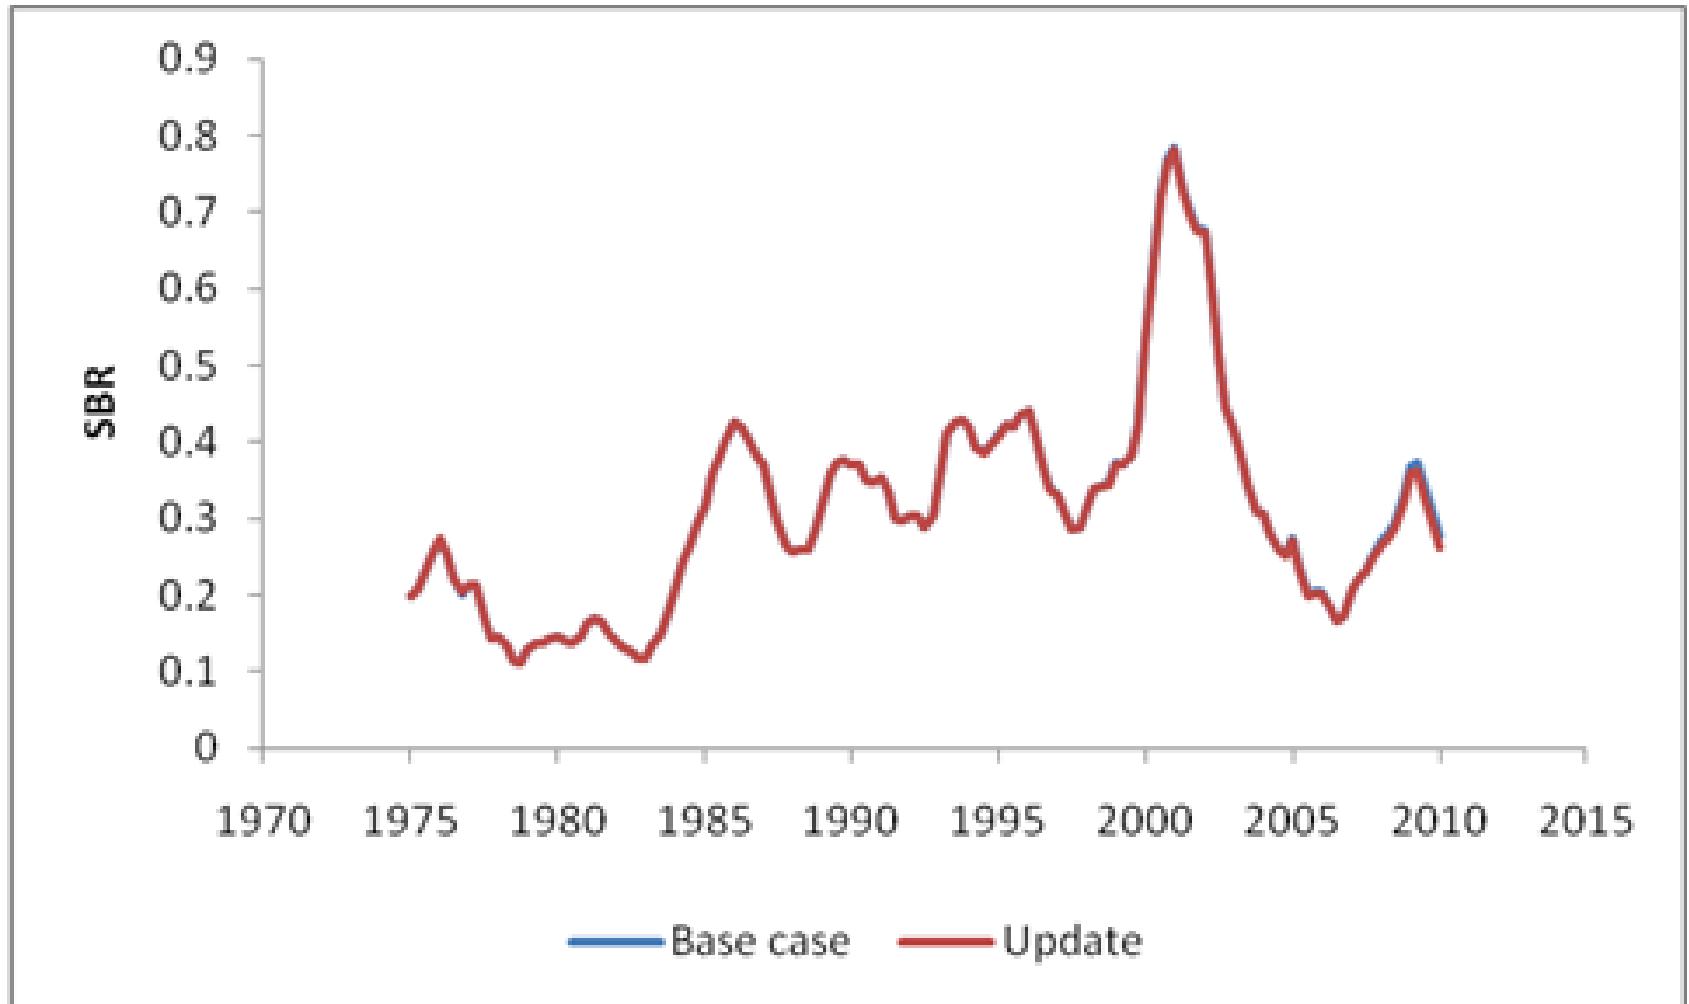

# Yield curves

# Updated Japanese CPUE data

# SBR comparison

# Conclusions

1. There is uncertainty about recent and future recruitment and biomass levels.
2. The recent fishing mortality rates are lower than those corresponding to the MSY.
3. Increasing the average weight of the yellowfin caught could increase the MSY.
4. There have been two, and possibly three, different productivity regimes, and the levels of MSY and the biomasses corresponding to the MSY may differ among the regimes. The population may have recently switched from the high to an intermediate productivity regime.
5. The results are more pessimistic if a stock-recruitment relationship is assumed.

The END
