SCIENTIFIC ADVISORY COMMITTEE

12TH MEETING

(by videoconference)

10-14 May 2021

DOCUMENT SAC-12-03

THE TUNA FISHERY IN THE EASTERN PACIFIC OCEAN IN 2020

Introduction.....	3
1. Catches and landings of tunas, billfishes, and associated species.....	3
2. Catches by species	4
3. Catches and fishing effort	6
4. Distributions of the catches of tropical tunas.....	7
5. Size compositions of the catches of tunas	7
6. The fleets.....	9

This report provides a summary of the catches and effort in 2020 of the fishery for tunas in the eastern Pacific Ocean (EPO), for whose management the Inter-American Tropical Tuna Commission (IATTC) is responsible. It is based on data available to the IATTC staff in March 2021; therefore, some of the data for 2020 are incomplete, and all data for 2019 and 2020 should be considered preliminary.

All weights of catches and discards are in metric tons (t). In the tables, 0 means no effort, or a catch of less than 0.5 t; - means no data collected; * means data missing or not available. The following acronyms are used:

Species:		Fishing gears:	
ALB	Albacore tuna (<i>Thunnus alalunga</i>)	FPN	Trap
BET	Bigeye tuna (<i>Thunnus obesus</i>)	GN	Gillnet

INTRODUCTION

This document summarizes the catches and effort of the fisheries for species covered by the IATTC's Antigua Convention ("tunas and tuna-like species and other species of fish taken by vessels fishing for tunas and tuna-like species") in the eastern Pacific Ocean (EPO) in 2020. The most important of these species are the scombrids (family Scombridae), which include tunas, bonitos, seerfishes, and some mackerels. The principal species of tunas caught are the three tropical tuna species (yellowfin, skipjack, and bigeye), followed by the temperate tunas (albacore, and lesser catches of Pacific bluefin); other scombrids, such as bonitos and wahoo, are also caught. In addition to the tunas, this document covers the billfishes (swordfish, marlins, shortbill spearfish, and sailfish).

There are important fisheries for dorado, sharks, and other species and groups that interact with the tuna fisheries in the EPO and are thus within the IATTC's remit. Information on these other species such as carangids (yellowtail, rainbow runner, and jack mackerel), dorado, elasmobranchs (sharks, rays, and skates), among others, is provided in Document SAC-12-12, *Ecosystem considerations*.

Access to the fisheries is regulated by Resolution [C-02-03](#), which allows only vessels on the IATTC [Regional Vessel Register](#) to fish for tunas in the EPO. Vessels are authorized to fish by their respective flag governments, and only duly authorized vessels are included in the Register. The Register lists, in addition to a vessel's name and flag, its fishing gear, dimensions, carrying capacity, date of construction, ownership, home port, and other characteristics. However, this requirement has not been applied to the thousands of small artisanal vessels, called *pangas*, that are known to catch tunas, among other species, in coastal waters of the EPO, but data on their numbers, effort, and catches are incomplete or unavailable. A pilot program, focused on sharks, to collect data on these fisheries in Central America is ongoing (SAC-11-14). The results of the pilot study will offer guidance in the development of a long-term sampling program in the region.

The IATTC staff has collected and compiled data on the longline fisheries since 1952, on catches of yellowfin and skipjack since 1954, bluefin since 1973, and bigeye since 1975. The data in this report, which are as accurate and complete as possible, are derived from various sources, including vessel logbooks, on-board observer data, unloading records provided by canners and other processors, export and import records, reports from governments and other entities, and the IATTC species and size composition sampling program.

1. CATCHES AND LANDINGS OF TUNAS, BILLFISHES, AND ASSOCIATED SPECIES

Almost all the catches in the EPO are made by the purse-seine and longline fleets; pole-and-line vessels, and various artisanal and recreational fisheries, account for a small percentage of the total catches. The IATTC staff compiles catch data for all fishing gears, including trolls, harpoons, and gillnets.

Detailed catch data are available for the purse-seine fishery, which takes over 90% of the total reported catches; the data for the other fisheries are incomplete. Purse-seine data for 2019 and 2020, and 2018-2020 data for longlines and other gears, are preliminary.

Since 1993 all Class-6² purse-seine vessels carry observers, who collect detailed data on catches, including those discarded at sea. Estimates of the "retained" catch (the portion of the total catch that is landed) are based principally on data collected during vessel unloadings.

Longline vessels, particularly the larger ones, fish primarily for bigeye, yellowfin, albacore, and swordfish. Data on the retained catches of most of the larger longline vessels are obtained from the vessels' flag

² Class 6: carrying capacity greater than 363 metric tons (t)

governments; data for smaller longliners, artisanal vessels, and other vessels that fish for species covered by the Antigua Convention are incomplete or unavailable, but some are obtained from vessel logbooks, or from governments or governmental reports.

Data for the western and central Pacific Ocean (WCPO) are taken from the [Tuna Fishery Yearbook for 2019](#), published by the Western and Central Pacific Fisheries Commission (WCPFC).

This report summarizes data from all the above sources. The estimated total catches of tropical tunas (yellowfin, skipjack, and bigeye) in the entire Pacific Ocean are shown in [Table A-1](#) and are discussed further in the sections below.

Estimates of the annual retained and discarded catches of tunas and other species taken by tuna-fishing vessels in the EPO during 1991-2020 are shown in [Tables A-2a-b](#).

The catches of tropical tunas during 1991-2020, by flag, are shown in [Tables A-3a-e](#), and the purse-seine catches and landings of tunas during 2019-2020 are summarized by flag in [Tables A-4a-b](#).

2. CATCHES BY SPECIES

2.1. Yellowfin tuna

The total annual catches of yellowfin in the Pacific Ocean during 1991-2020 are shown in [Table A-1](#). The 2020 EPO catch of 219 thousand t is 6% less than the average of 233 thousand t for the previous 5-year period (2015-2019). In the WCPO, the catches of yellowfin reached a record high of 711 thousand t in 2017.

The annual retained catches of yellowfin in the EPO, by gear, during 1991-2020 are shown in [Table A-2a](#). Over the most recent 15-year period (2005-2019), the annual retained purse-seine and pole-and-line catches have fluctuated around an average of 221 thousand t (range: 167 to 270 thousand t). The preliminary estimate of the retained catch in 2020, 219 thousand t, is 4% less than that of 2019, but 1% less than the 2005-2019 average. On average, about 0.4% (range: 0.1 to 1.0%) of the total purse-seine catch of yellowfin was discarded at sea during 2005-2019 ([Table A-2a](#)).

During 1991-2005, annual longline catches in the EPO averaged about 22 thousand t (range: 12 to 31 thousand t), or about 7% of the total retained catches of yellowfin. They then declined sharply, to an annual average of 10 thousand t (range: 8 to 13 thousand t), or about 4% of the total retained catches, during 2006-2019. Catches by other fisheries (recreational, gillnet, troll, artisanal, etc.), whether incidental or targeted, are shown in [Table A-2a](#), under “Other gears” (OTR); during 2006-2019 they averaged about 2 thousand t.

2.2. Skipjack tuna

The total annual catches of skipjack in the Pacific Ocean during 1991-2020 are shown in [Table A-1](#). Most of the catch is taken in the WCPO. Prior to 1998, WCPO catches averaged about 900 thousand t; subsequently, they increased steadily, from 1.1 million t to an all-time high of 2 million t in 2019. In the EPO, the greatest catches occurred between 2004 and 2020, ranging from 153 to 351 thousand t, the record catch in 2019.

The annual retained catches of skipjack in the EPO, by gear, during 1991-2020 are shown in [Table A-2a](#). During 2005-2019 the annual retained purse-seine and pole-and-line catch averaged 277 thousand t (range: 147 to 347 thousand t). The preliminary estimate of the retained catch in 2020, 297 thousand t, is 7% greater than the 15-year average for 2005-2019.

Discards of skipjack at sea decreased each year during the period, from 6% in 2005 to a low of less than 1% in 2018, averaging about 2% of the total catch of the species ([Table A-2a](#)).

Catches of skipjack in the EPO by longlines and other gears are negligible ([Table A-2a](#)).

2.3. Bigeye tuna

The total annual catches of bigeye in the Pacific Ocean during 1991-2020 are shown in [Table A-1](#). Overall, the catches in both the EPO and WCPO have increased, but with considerable fluctuations. In the WCPO they averaged more than 77 thousand t during the late 1970s, decreased during the early 1980s, and then increased steadily to 127 thousand t in 1992; they jumped to 146 thousand t in 1999, and reached a high of 170 thousand t in 2004, since when they have fluctuated between 122 and 159 thousand t. In the EPO, the average catch during 1991-2020 was 104 thousand t, with a low of 75 thousand t in 2020 and a high of 149 thousand t in 2000.

The annual retained catches of bigeye in the EPO by purse-seine and pole-and-line vessels during 1991-2020 are shown in [Table A-2a](#). The introduction of fish-aggregating devices (FADs), placed in the water by fishers to attract tunas, in 1993 led to a sudden and dramatic increase in the purse-seine catches. Prior to 1993, the annual retained purse-seine catch of bigeye in the EPO was about 5 thousand t ([Table A-2a](#)); by 1994 it was 35 thousand t, and in 1996 was over 60 thousand t. During 1998-2019 it has fluctuated between 44 and 95 thousand t; the preliminary estimate for 2020 is 75 thousand t.

During 2000-2020 the percentage of the purse-seine catch of bigeye discarded at sea has steadily decreased, from 5% in 2000 to less than 1% in 2014 and 2020, averaging about 1.6%.

Before the expansion of the FAD fishery, longliners caught almost all the bigeye in the EPO, averaging 88 thousand t annually during 1985-1992. Since 1993, the annual average catch has declined by 50%, to 44 thousand t, and the preliminary estimate for 2019 is less than 27 thousand t ([Table A-2a](#)).

Small amounts of bigeye are caught in the EPO by other gears ([Table A-2a](#)).

2.4. Pacific bluefin tuna

The catches of Pacific bluefin in the entire Pacific Ocean, by flag and gear, as reported by the vessels' flag governments to the International Scientific Committee for Tuna and Tuna-like Species in the North Pacific Ocean (ISC), are shown in [Table A-5a](#).

The catches of Pacific bluefin in the EPO during 1991-2020, by gear, are shown in [Table A-2a](#). In recent years, purse-seine vessels accounted for over 93% of the annual catch. The 1991-2019 average EPO retained catch is 3.7 thousand t (range: 400 t to 9.9 thousand t); the preliminary estimate for 2020 is 3.4 thousand t ([Table A-2a](#)).

Catches of Pacific bluefin by recreational gear in the EPO are reported in numbers of individual fish caught, whereas all other gears report catches in weight; the data are therefore converted to weights for inclusion in the EPO catch totals. The original catch data for 1991-2020, in numbers of fish, are presented in [Table A-5b](#).

2.5. Albacore tuna

Data provided by the relevant CPCs on catches of albacore in the EPO, by gear and area (north and south of the equator), are shown in [Table A-6](#), and for the entire EPO in [Table A-2a](#). A portion of the albacore catch is taken by troll vessels (LTL), included under "Other gears" (OTR) in [Table A-2a](#).

2.6. Other tunas and tuna-like species

While yellowfin, skipjack, and bigeye tunas comprise the great majority of the retained purse-seine catches in the EPO, other tunas and tuna-like species, such as albacore, black skipjack, bonito, frigate and bullet tunas, contribute to the overall harvest. The estimated annual retained and discarded catches of these species during 1991-2020 are shown in [Table A-2a](#). The catches reported in the "unidentified tunas" (TUN) category in [Table A-2a](#) contain some catches reported by species (frigate and bullet tunas) along

with the unidentified tunas. The total retained catch of these other species by the purse-seine fishery in 2020 was 7.3 thousand t, less than the 2005-2019 average of 9.1 thousand t (range: 2 to 19 thousand t).

Black skipjack are also caught by other gears in the EPO, mostly by coastal artisanal fisheries. Bonitos are also caught by artisanal fisheries, and have been reported as catch by longline vessels in some years.

2.7. Billfishes

Catch data for billfishes (swordfish, blue marlin, black marlin, striped marlin, shortbill spearfish, and sailfish) are shown in [Table A-2b](#).

Swordfish are caught in the EPO with large-scale and artisanal longlines, gillnets, harpoons, and occasionally with recreational gear. During 1999-2013 the longline catch averaged 15 thousand t, but during 2014-2016 this increased by about 50%, to over 23 thousand t, possibly due to increased abundance of swordfish, increased effort directed toward the species, increased reporting, or a combination of all of these.

Other billfishes are caught with large-scale and artisanal longlines and recreational gear. The average annual longline catches of blue marlin and striped marlin during 2005-2019 were about 3.2 thousand and 1.8 thousand t, respectively. Smaller amounts of other billfishes are taken by longline.

Little information is available on the recreational catches of billfishes, but, the retained catches are believed to be substantially less than the commercial catches for all species, due to catch-and-release practices.

Billfishes are caught incidentally in the purse-seine fisheries, which during 2005-2019 accounted for about 1% of the total catch of billfishes in the EPO. Prior to 2011, they were all classified as discarded dead; however, the growing rate of retention of such bycatches made it important to reflect this in the data, and since 2011 retained catch and discards are reported separately in [Table A-2b](#).

3. CATCHES AND FISHING EFFORT

3.1. Purse seine

Estimates of the numbers of purse-seine sets of each type (associated with dolphins (DEL), associated with floating objects (OBJ), and unassociated (NOA)) in the EPO during 2005-2020, and the retained catches from those sets, are shown in [Table A-7](#) and [Figure 1](#).³ The estimates for Class 1-5⁴ vessels were calculated from logbook data in the IATTC statistical data base, and those for Class-6 vessels from the observer data bases of the IATTC, Colombia, Ecuador, the European Union, Mexico, Nicaragua, Panama, the United States, and Venezuela.

³ The catch data for 2005-2020 incorporate previously unavailable data, and are thus different from the corresponding data presented in previous publications.

⁴ ≤363 t carrying capacity

Since the introduction of artificial fish-aggregating devices (FADs) in the mid-1990s, they have become predominant in the floating-object fishery, and now account for an estimated 98% of all floating-object sets by Class-6 vessels ([Table A-8](#)).

3.2. Longline

The reported nominal fishing effort (in thousands of hooks) by longline vessels in the EPO, and their catches of the predominant tuna species, are shown in [Table A-9](#).

4. DISTRIBUTIONS OF THE CATCHES OF TROPICAL TUNAS

4.1. Purse-seine catches

The average annual distributions of purse-seine catches, by set type, of tropical tunas (yellowfin, skipjack, and bigeye) in the EPO during 2015-2019 are shown in [Figures A-1a](#), [A-2a](#), and [A-3a](#), respectively, and preliminary estimates for 2020 are shown in [Figures A-1b](#), [A-2b](#), and [A-3b](#).

Yellowfin: The majority of catches in 2020 were taken in sets associated with dolphins in two principal areas: north of 5°N from 105°W to 135°W, and inshore north of the equator from 100°W to the coast. Lesser amounts were taken in dolphin and floating-object sets throughout the EPO south of 10°N ([Figure A-1b](#)).

Skipjack is caught primarily in unassociated tuna sets and floating object sets. The majority of catches in 2020 were taken south of 10°N throughout the EPO, in sets associated with floating objects and in unassociated tuna sets east of 100°W and south along the coast. Unlike previous years, the majority of the skipjack catch far offshore near the western border of the EPO was taken in floating object sets, while more of the skipjack catch near the coast of the Americas was taken in unassociated tuna sets. ([Figure A-2b](#)).

Bigeye are not often caught north of about 7°N in the EPO. Almost all of the 2020 catches were taken in sets on FADs far offshore close to the equator, with a lesser concentration around 10°S between 105°W and 120°W ([Figure A-3b](#)).

4.2. Longline catches

Since 2009, the IATTC has received tuna catch and effort data from Belize, China, France (French Polynesia), Japan, the Republic of Korea, Panama, Chinese Taipei, the United States, and Vanuatu. Albacore, bigeye and yellowfin tunas make up the majority of the catches by most of these vessels. The distributions of the catches of bigeye and yellowfin in the Pacific Ocean by Chinese, Japanese, Korean, and Chinese Taipei longline vessels during 2015-2019 are shown in [Figure A-4](#).

5. SIZE COMPOSITIONS OF THE CATCHES OF TUNAS

5.1. Purse-seine, pole-and-line, and recreational fisheries

Length-frequency samples are the basic source of data used for estimating the size and age compositions of the various species of fish in the landings. This information is necessary to obtain age-structured

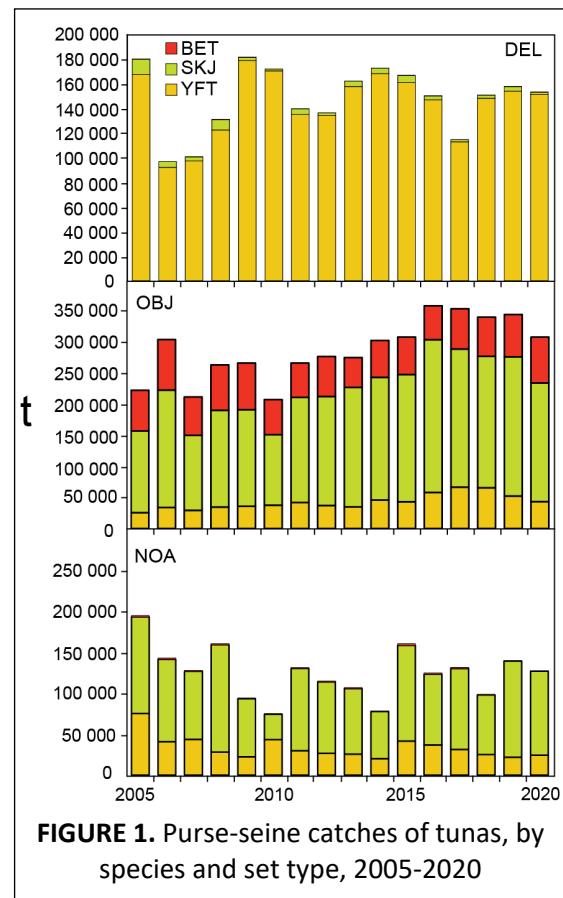

FIGURE 1. Purse-seine catches of tunas, by species and set type, 2005-2020

estimates of the populations for various purposes, primarily the integrated modeling that the staff uses to assess the status of the stocks (see [Stock Assessment Reports](#)). Length-frequency samples are obtained from the catches of purse-seine vessels in the EPO by IATTC personnel at ports of landing in Ecuador, Mexico, Panama, and Venezuela. The methods for sampling the catches of tunas are described in the [IATTC Annual Report for 2000](#) and in IATTC [Stock Assessment Reports 2](#) and [4](#).

Historical long-term time series of size-composition data for yellowfin and bigeye are available in the [Stock Assessment Reports](#), and average length stock status indicators (SSIs) are available for yellowfin, bigeye and skipjack ([SAC-12-05](#)). In this report, data on the size composition of the catches during 2015-2020 are presented ([Figures A-6 to A-8](#)), with two sets of length-frequency histograms for each species: the first shows the data for 2020 by stratum (gear type, set type, and area), and the second the combined data for each year of the 2015-2020 period.

Yellowfin: nine purse-seine fisheries (four associated with floating objects (OBJ), three associated with dolphins (DEL), and two unassociated (NOA)) and one pole-and-line (LP) fishery, which includes all 13 sampling areas) are defined ([Figure A-5](#)). Of the 448 wells sampled during 2020, 354 contained yellowfin. The estimated size compositions of the fish caught are shown in [Figure A-6a](#). Most of the yellowfin catch was taken in the DEL fisheries during the first half of the year, with smaller amounts taken in the OBJ-N fishery in the first quarter and the NOA-N fishery in the second quarter. Large yellowfin (140-160 cm) were caught in the NOA-S fishery in the second quarter, while yellowfin in the 110-150 cm range were caught in the DEL-N fishery throughout the year. Smaller yellowfin (<60 cm) were taken in the OBJ fishery primarily in the first and second quarters.

The estimated size compositions of the yellowfin caught by all fisheries combined during 2015-2020 are shown in [Figure A-6b](#). The average weight of yellowfin in 2020, 10.6 kg, was much higher than the previous 4 years (6.3-7.7 kg), and the size distribution also showed a trend toward larger fish, with the greatest quantity around the 100-150 cm range.

Skipjack: seven purse-seine fisheries (four OBJ, two NOA, one DEL) and one LP fishery are defined ([Figure A-5](#)); the last two include all 13 sampling areas. Of the 448 wells sampled, 243 contained skipjack. The estimated size compositions of the fish caught during 2020 are shown in [Figure A-7a](#). Most of the skipjack catch was taken in the OBJ-N, OBJ-E and OBJ-S fisheries in the second, third and fourth quarters, and in the NOA-S fishery in the first and second quarters. Larger skipjack (60-70 cm) were caught in the NOA-S fishery in the second quarter. The smallest (<40 cm) were caught primarily in the OBJ-N, OBJ-E and OBJ-S fisheries in the third quarter, and in the OBJ-S fishery in the fourth quarter.

The estimated size compositions of skipjack caught by all fisheries combined during 2015-2020 are shown in [Figure A-7b](#). The average weight of skipjack in 2020 (2.0 kg) was consistent with previous years (1.8-2.2 kg).

Bigeye: six purse-seine fisheries (four OBJ, one NOA, one DEL) and one LP fishery are defined ([Figure A-5](#)); all except the OBJ fisheries include all 13 sampling areas. Of the 448 wells sampled, 77 contained bigeye. The estimated size compositions of the fish caught during 2020 are shown in [Figure A-8a](#). Most of the bigeye catch was taken in the OBJ-N fishery in the first and second quarters, and in the OBJ-S fishery throughout the year. Lesser amounts were caught in the OBJ-E fishery in the third quarter.

The estimated size compositions of bigeye caught by all fisheries combined during 2015-2020 are shown in [Figure A-8b](#). The average weight of bigeye in 2020 (5.1 kg) was slightly higher than the previous five years (4.7-5.0 kg). More large bigeye in the 50-100 cm range was caught in 2020 than in previous years, while less of the largest bigeye (>120 cm) was caught.

Pacific bluefin are caught by purse-seine and recreational gears off California and Baja California, historically from about 23°N to 35°N, but only between 28°N and 32°N in recent years. The 2020 purse-

seine fishing season continued the trend of starting earlier than any previous year: in 2020, bluefin were first caught in early January, and the fishery was closed in early February, when the annual catch limit was reached. Most of the catch is transported live to grow-out pens near the coast of Mexico. Mexico's National Fisheries Institute (INAPESCA) provided length-composition data for purse-seine catches during 2014-2019 ([Figure A-9](#)). PBF length composition data from INAPESCA for 2020 was not available at the time of preparation of this report.

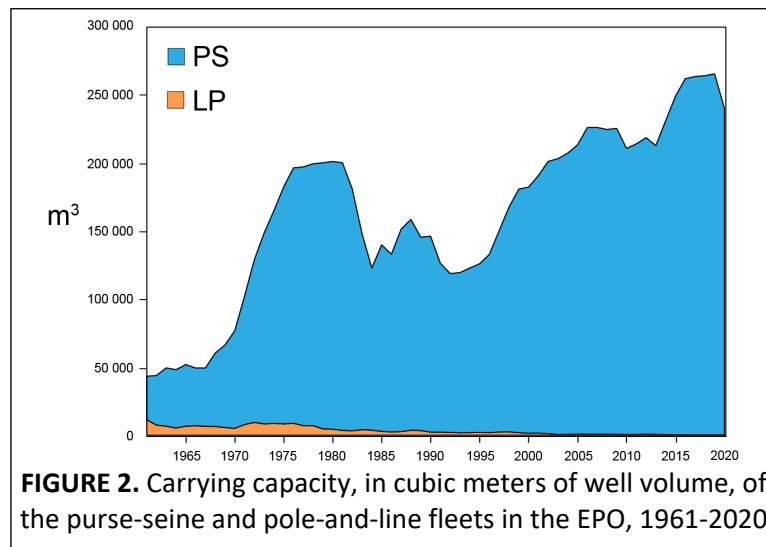

FIGURE 2. Carrying capacity, in cubic meters of well volume, of the purse-seine and pole-and-line fleets in the EPO, 1961-2020

5.2. Longline fishery

The size compositions of yellowfin and bigeye caught by the Japanese longline fleet (commercial and training vessels) in the EPO during 2015-2019 are shown in [Figures A-10](#) and [A-11](#). The average annual weight during that period ranged from 36.8 to 61.0 kg for yellowfin, and from 61.7 kg to 66.2 kg for bigeye.

5.3. Catches of tunas, by flag and gear

The annual retained catches of tunas in the EPO during 1991-2020, by flag and gear, are shown in [Tables A-3a-e](#). The purse-seine catches of tunas in 2019 and 2020, by flag and species, are summarized in [Table A-4a](#). Of the nearly 602 thousand t of tunas caught in 2020, 46% were caught by Ecuadorian vessels, and 20% by Mexican vessels. Other countries with significant catches included Panama (12%), Colombia (6%), Venezuela (5%), United States (4%), Nicaragua (3%) and Peru (1%). The purse-seine landings of tunas in 2019 and 2020, by species and country of landing, are summarized in [Table A-4b](#). Of the more than 610 thousand t of tunas landed in the EPO in 2020, 64% were landed in Ecuadorian ports, and 20% in Mexican ports. Other countries with landings of tunas in the EPO included Colombia (5%), Peru (2%) and the United States (1%).

6. THE FLEETS

6.1. Purse seine

The IATTC [Regional Vessel Register](#) contains detailed records of all purse-seine vessels that are authorized to fish for tunas in the EPO. However, only vessels that fished for yellowfin, skipjack, bigeye, and/or Pacific bluefin tuna in the EPO in 2020 are included in the following description of the purse-seine fleet.

The IATTC uses well volume, in cubic meters (m^3), to measure the carrying capacity of purse-seine vessels. Reliable well volume data are available for almost all purse-seine vessels; the well volume of vessels lacking such data is calculated by applying a conversion factor to their capacity in tons ([Table A-10](#); [Figure 2](#)).

The 2019 and preliminary 2020 data for numbers and total well volumes of purse-seine vessels that fished for tunas in the EPO are shown in [Tables A-11a](#) and [A-11b](#). During 2020, the fleet was dominated by Ecuadorian and Mexican vessels, with about 36% and 24%, respectively, of the total well volume; they were followed by the Panama (11%), United States (7%), Venezuela (7%), Colombia

(6%), El Salvador (3%), Nicaragua (2%), Peru (2%) and the European Union (Spain) (2%).⁵

The cumulative capacity at sea during 2020 is compared to those of the previous five years in [Figure 3](#).

The monthly average, minimum, and maximum total well volumes at sea (VAS), in thousands of cubic meters, of purse-seine and pole-and-line vessels that fished for tunas in the EPO during 2010-2019, and the 2020 values, are shown in [Table A-12](#). The monthly values are averages of the VAS estimated at weekly intervals by the IATTC staff. The average VAS values for 2010-2019 and 2020 were slightly over 142 thousand m³ (59% of total capacity) and about 130 thousand m³ (54% of total capacity), respectively.

6.2. Other fleets of the EPO

Information on other types of vessels that are authorized to fish in the EPO is available in the IATTC's [Regional Vessel Register](#). In some cases, particularly for large longline vessels, the Register contains information for vessels authorized to fish not only in the EPO, but also in other oceans, and which may not have fished in the EPO during 2020, or ever.

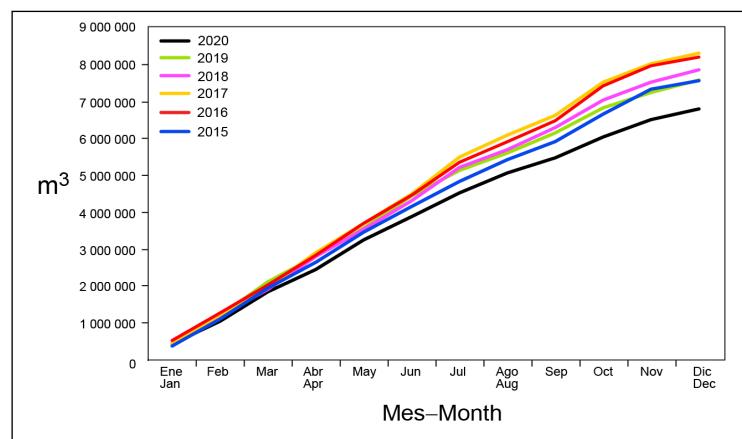

FIGURE 3. Cumulative capacity of the purse-seine and pole-and-line fleet at sea, by month, 2015-2020

⁵ The sum of the percentages may not add up to 100% due to rounding.

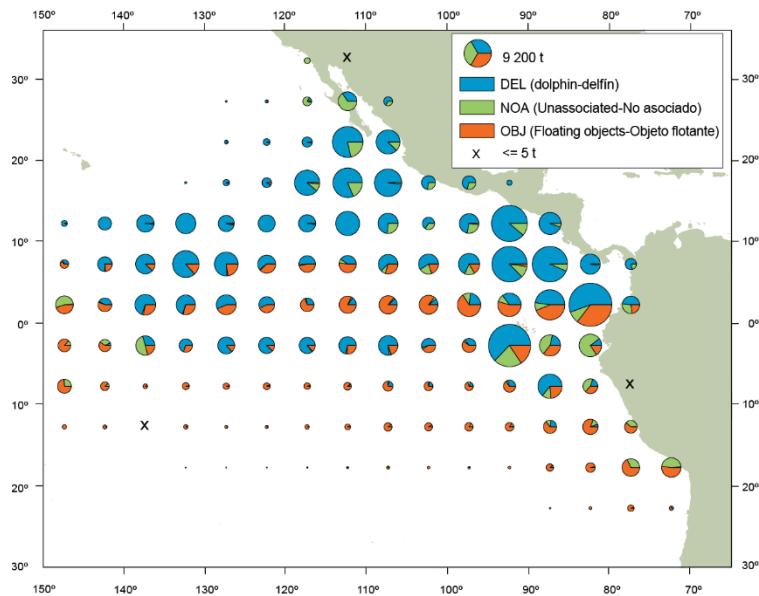

FIGURE A-1a. Average annual distributions of the purse-seine catches of yellowfin, by set type, 2015-2019. The sizes of the circles are proportional to the amounts of yellowfin caught in those 5° by 5° areas.

FIGURA A-1a. Distribución media anual de las capturas cerqueras de aleta amarilla, por tipo de lance, 2015-2019. El tamaño de cada círculo es proporcional a la cantidad de aleta amarilla capturado en la cuadrícula de 5° x 5° correspondiente.

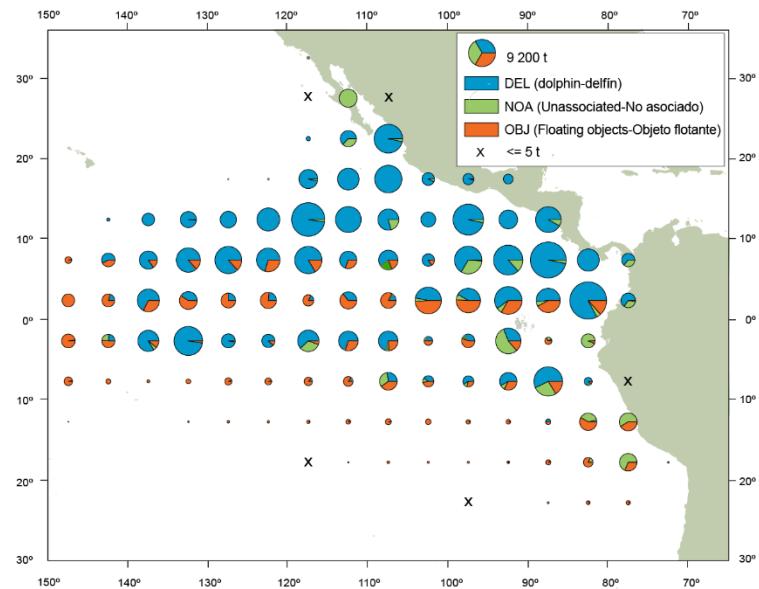

FIGURE A-1b. Annual distributions of the purse-seine catches of yellowfin, by set type, 2020. The sizes of the circles are proportional to the amounts of yellowfin caught in those 5° by 5° areas.

FIGURA A-1b. Distribución anual de las capturas cerqueras de aleta amarilla, por tipo de lance, 2020. El tamaño de cada círculo es proporcional a la cantidad de aleta amarilla capturado en la cuadrícula de 5° x 5° correspondiente.

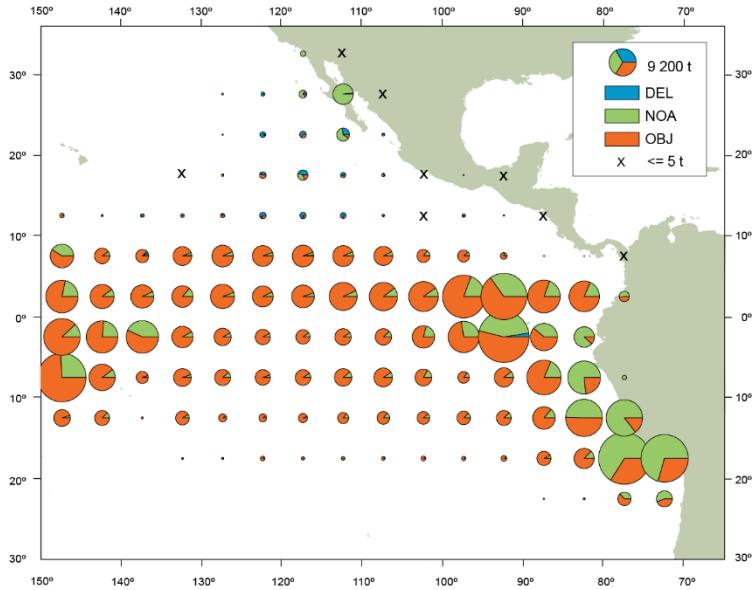

FIGURE A-2a. Average annual distributions of the purse-seine catches of skipjack, by set type, 2015-2019. The sizes of the circles are proportional to the amounts of skipjack caught in those 5° by 5° areas.

FIGURA A-2a. Distribución media anual de las capturas cerqueras de barrilete, por tipo de lance, 2015-2019. El tamaño de cada círculo es proporcional a la cantidad de barrilete capturado en la cuadrícula de $5^{\circ} \times 5^{\circ}$ correspondiente.

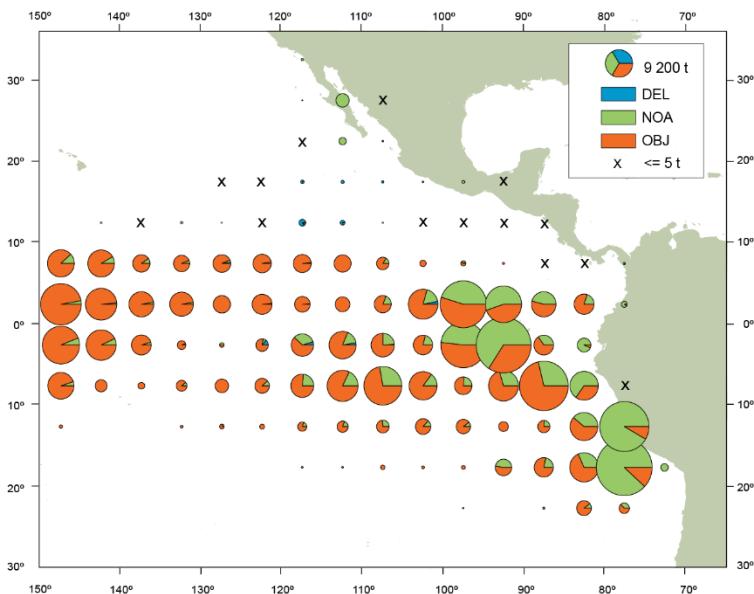

FIGURE A-2b. Annual distributions of the purse-seine catches of skipjack, by set type, 2020. The sizes of the circles are proportional to the amounts of skipjack caught in those 5° by 5° areas.

FIGURA A-2b. Distribución anual de las capturas cerqueras de barrilete, por tipo de lance, 2020. El tamaño de cada círculo es proporcional a la cantidad de barrilete capturado en la cuadrícula de $5^{\circ} \times 5^{\circ}$ correspondiente.

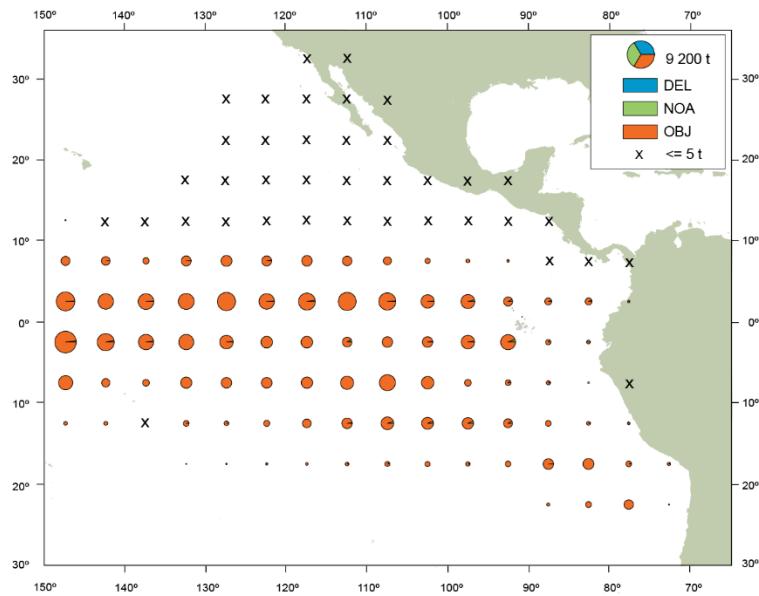

FIGURE A-3a. Average annual distributions of the purse-seine catches of bigeye, by set type, 2015-2019. The sizes of the circles are proportional to the amounts of bigeye caught in those 5° by 5° areas.

FIGURA A-3a. Distribución media anual de las capturas cerqueras de patudo, por tipo de lance, 2015-2019. El tamaño de cada círculo es proporcional a la cantidad de patudo capturado en la cuadrícula de $5^{\circ} \times 5^{\circ}$ correspondiente.

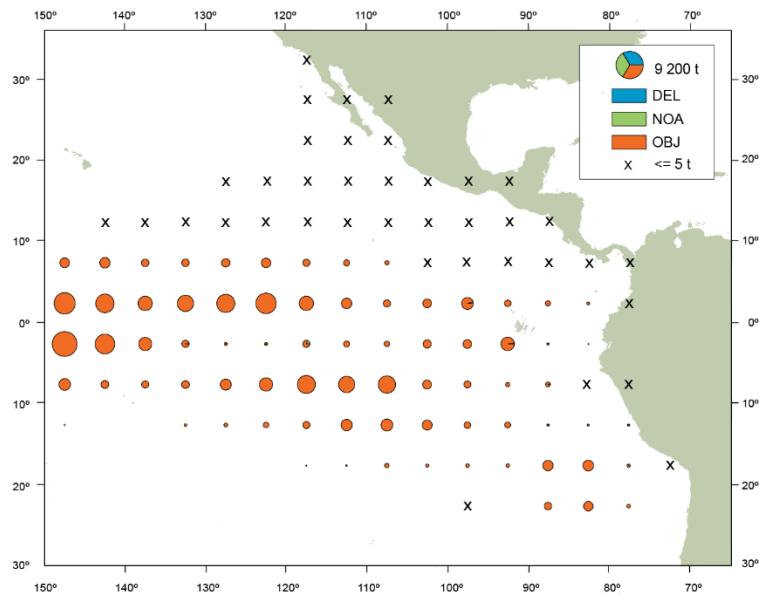

FIGURE A-3b. Annual distributions of the purse-seine catches of bigeye, by set type, 2020. The sizes of the circles are proportional to the amounts of bigeye caught in those 5° by 5° areas.

FIGURA A-3b. Distribución anual de las capturas cerqueras de patudo, por tipo de lance, 2020. El tamaño de cada círculo es proporcional a la cantidad de patudo capturado en la cuadrícula de $5^{\circ} \times 5^{\circ}$ correspondiente.

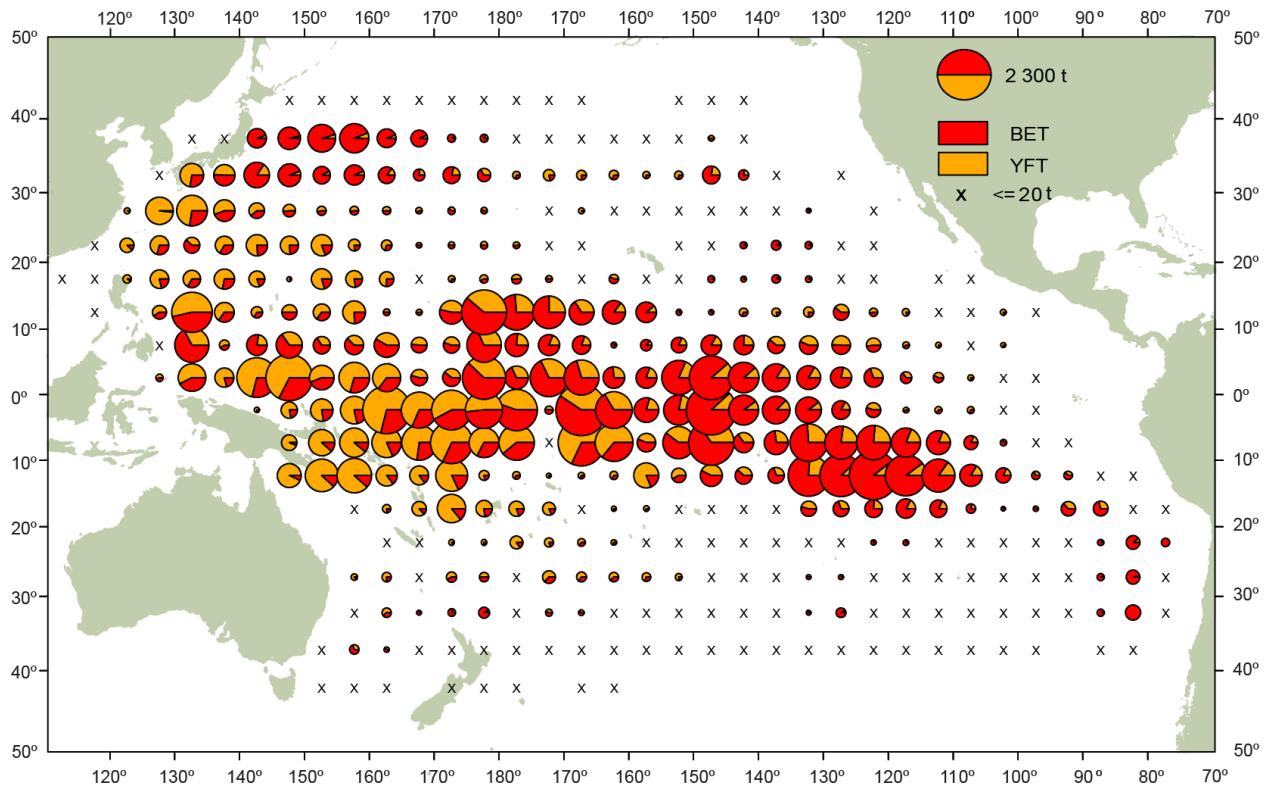

FIGURE A-4. Distributions of the average annual catches of bigeye and yellowfin tunas in the Pacific Ocean, in metric tons, by Chinese, Japanese, Korean, and Chinese Taipei longline vessels, 2015-2019. The sizes of the circles are proportional to the amounts of bigeye and yellowfin caught in those 5° by 5° areas.

FIGURA A-4. Distribución de las capturas anuales medias de atunes patudo y aleta amarilla en el Océano Pacífico, en toneladas métricas, por buques palangreros de China, Corea, Japón, y Taipeí Chino, 2015-2019. El tamaño de cada círculo es proporcional a la cantidad de patudo y aleta amarilla capturado en la cuadrícula de 5° x 5° correspondiente.

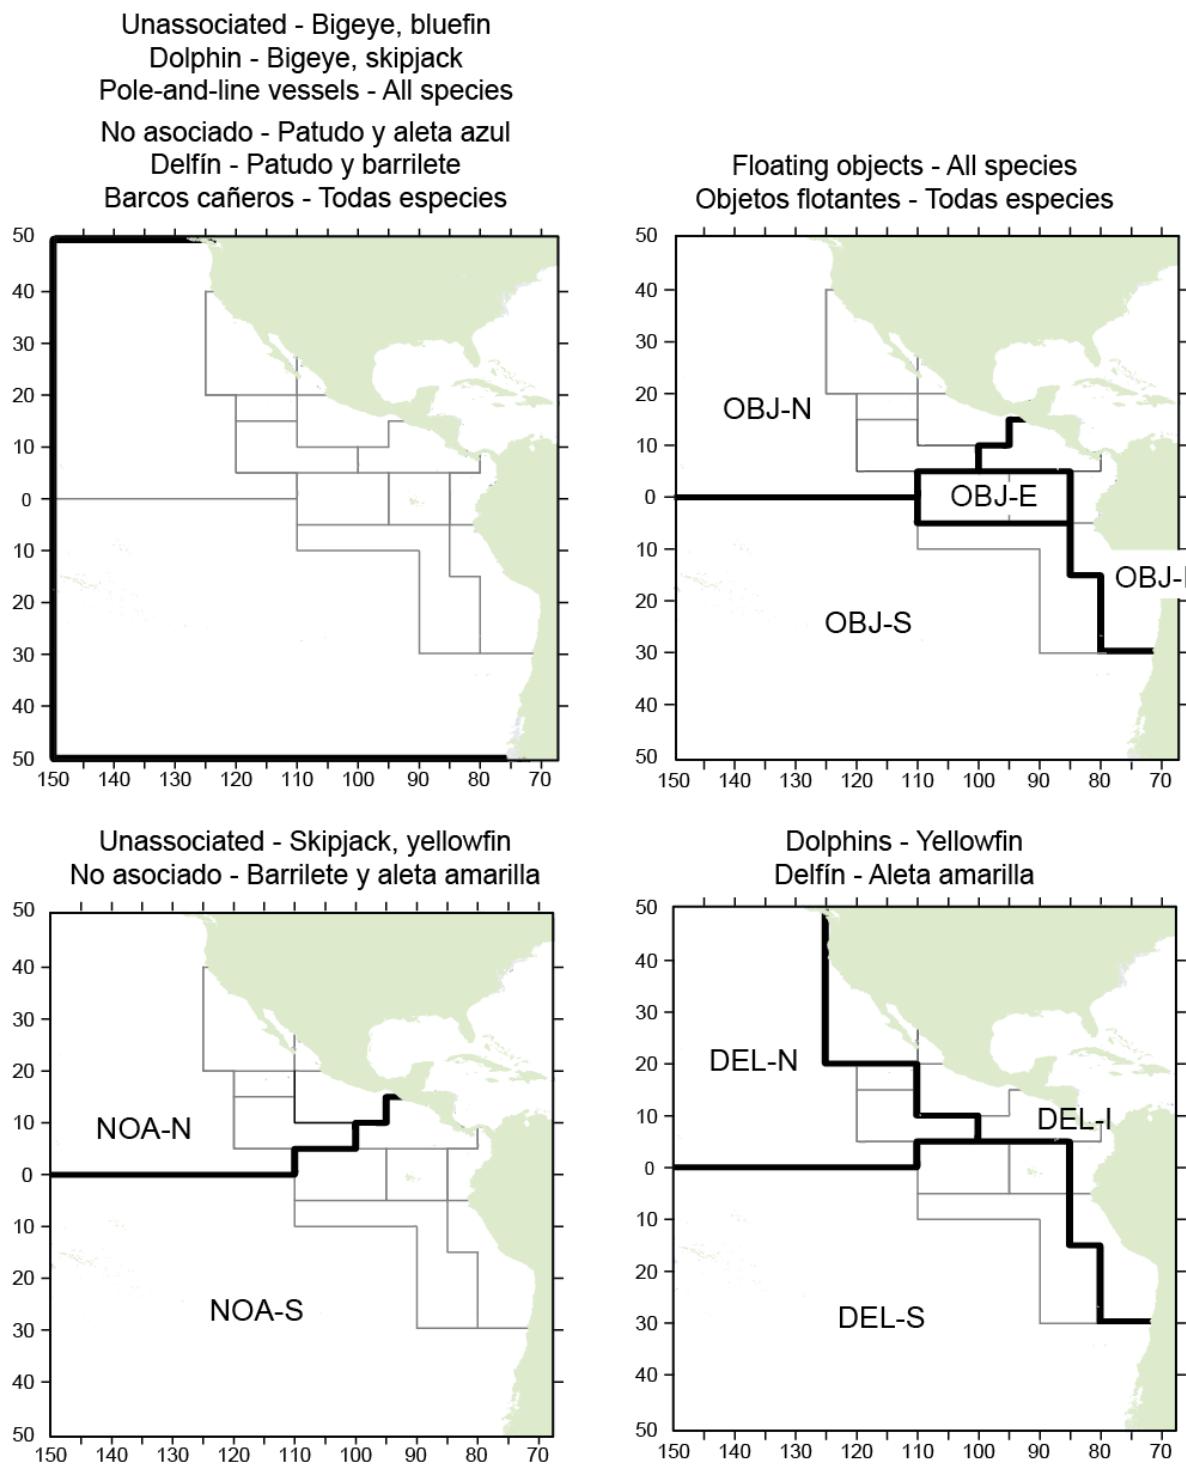

FIGURE A-5. The purse-seine fisheries defined by the IATTC staff for analyses of yellowfin, skipjack, and bigeye in the EPO. The thin lines indicate the boundaries of the 13 length-frequency sampling areas, and the bold lines the boundaries of the fisheries.

FIGURA A-5. Las pesquerías cerqueras definidas por el personal de la CIAT para los análisis de los atunes aleta amarilla, barrilete, y patudo en el OPO. Las líneas delgadas indican los límites de las 13 zonas de muestreo de frecuencia de tallas, y las líneas gruesas los límites de las pesquerías.

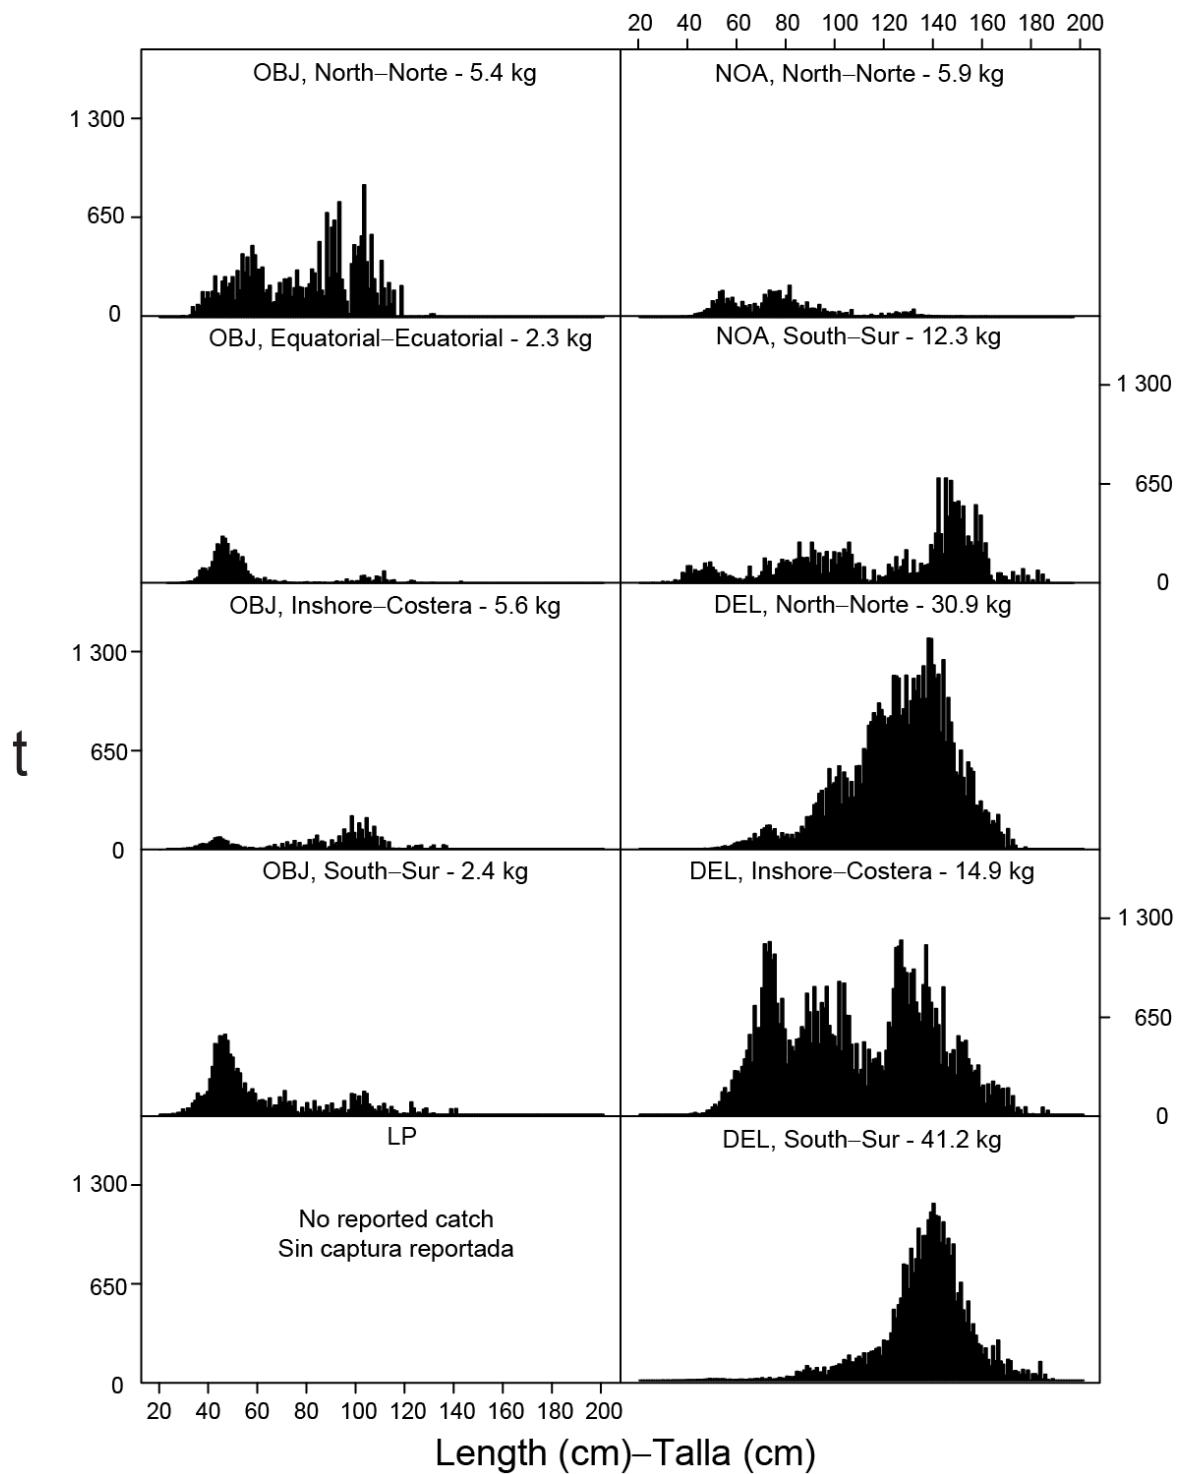

FIGURE A-6a. Estimated size compositions of the yellowfin caught in the EPO during 2020 for each fishery designated in Figure A-5. The value at the top of each panel is the average weight of the fish in the samples.

FIGURA A-6a. Composición por tallas estimada del aleta amarilla capturado en el OPO durante 2020 en cada pesquería ilustrada en la Figura A-5. El valor en cada recuadro representa el peso promedio del pescado en las muestras.

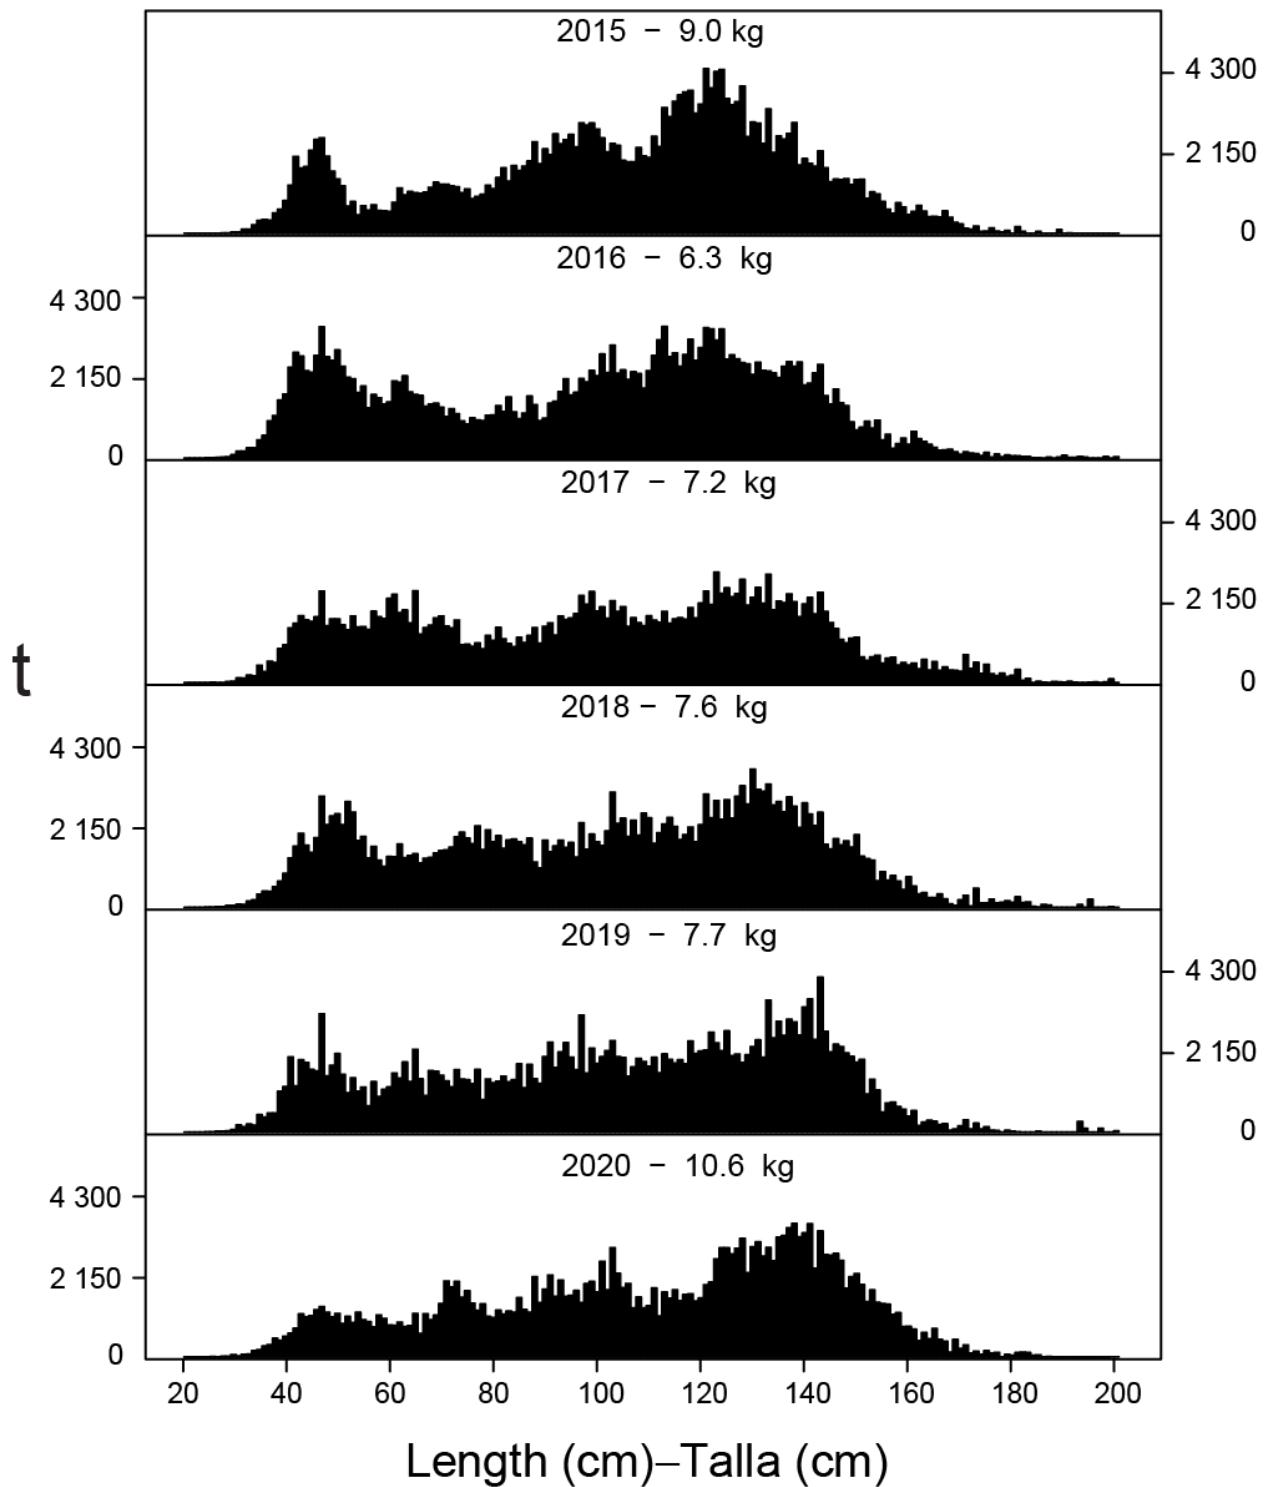

FIGURE A-6b. Estimated size compositions of the yellowfin caught by purse-seine and pole-and-line vessels in the EPO during 2015-2020. The value at the top of each panel is the average weight of the fish in the samples.

TABLE A-2a. Estimated catches, in metric tons, of tunas and bonitos in the EPO, by fishing gear, 1991-2020. For purse-seine (PS) vessels, retained (Ret.) catches include all vessels; discard (Dis.) data are for Class-6 vessels only. 'C' indicates that the catch has been combined with the total in the 'OTR' column. The purse-seine and pole-and-line (LP) data for yellowfin, skipjack, and bigeye tunas have been adjusted to the species composition estimate, and are preliminary. The data for 2019-2020 are preliminary.

TABLA A-2a. Capturas estimadas, en toneladas métricas, de atunes y bonitos en el OPO, por arte de pesca, 1991-2020. En el caso de los buques de cerco (PS), las capturas retenidas (Ret) incluyen todos los buques; los datos de descartes (Dis.) son de buques de Clase 6 únicamente. 'C' indica que la captura se ha combinado con el total en la columna 'OTR'. Los datos de los atunes aleta amarilla, barrilete, y patudo de las pesquerías de cerco y de caña (LP) fueron ajustados a la estimación de composición por especies, y son preliminares. Los datos de 2019-2020 son preliminares.

[§] Class-6 (carrying capacity >363 t) purse-seine vessels only-Buques cerqueros de Clase 6 (capacidad de acarreo >363 t) solamente

TABLE A-2b. Estimated catches, in metric tons, of billfishes in the EPO, by fishing gear, 1991-2020. Purse-seine (PS) vessel data are for Class-6 vessels only. The data for 2019-2020 are preliminary.

TABLA A-2b. Capturas estimadas, en toneladas métricas, de peces picudos en el OPO, por arte de pesca, 1991-2020. En el caso de los buques de cerco (PS), los datos son de buques de Clase 6 únicamente. Los datos de 2019-2020 son preliminares.

TABLE A-4a. Preliminary estimates of the retained catches, in metric tons, of tunas and bonitos caught by purse-seine vessels in the EPO in 2019 and 2020, by species and vessel flag. The data for yellowfin, skipjack, and bigeye tunas have been adjusted to the species composition estimates, and are preliminary.

TABLA A-4a. Estimaciones preliminares de las capturas retenidas, en toneladas métricas, de atunes y bonitos por buques cerqueros en el OPO en 2019 y 2020, por especie y bandera del buque. Los datos de los atunes aleta amarilla, barrilete, y patudo fueron ajustados a las estimaciones de composición por especie, y son preliminares.

TABLE A-7. Estimated numbers of sets, by set type and vessel capacity category, and estimated retained catches, in metric tons, of yellowfin, skipjack, and bigeye tuna by purse-seine vessels in the EPO. The data for 2019 and 2020 are preliminary. The data for yellowfin, skipjack, and bigeye tunas have been adjusted to the species composition estimate and are preliminary.

TABLA A-7. Números estimados de lances, por tipo de lance y categoría de capacidad de buque, y capturas retenidas estimadas, en toneladas métricas, de atunes aleta amarilla, barrilete, y patudo por buques cerqueros en el OPO. Los datos de 2019 y 2020 son preliminares. Los datos de los atunes aleta amarilla, barrilete, y patudo fueron ajustados a la estimación de composición por especie, y son preliminares.

TABLE A-11a. Estimates of the numbers and well volume (cubic meters) of purse-seine (PS) and pole-and-line (LP) vessels that fished in the EPO in 2019, by flag and gear. Each vessel is included in the total for each flag under which it fished during the year but is included only once in the “Grand total”; therefore, the grand total may not equal the sums of the individual flags.

TABLA A-11a. Estimaciones del número y volumen de bodega (metros cúbicos) de buques cerqueros (PS) y cañeros (LP) que pescaron en el OPO en 2019 por bandera y arte de pesca. Se incluye cada buque en los totales de cada bandera bajo la cual pescó durante el año, pero solamente una vez en el “Total general”; por consiguiente, los totales generales no equivalen necesariamente a las sumas de las banderas individuales.

Flag Bandera	Gear Arte	Well volume—Volumen de bodega (m ³)					Total	
		<401	401-800	801-1300	1301-1800	>1800	No.	Vol. (m ³)
		Number—Número
