Inter-American Tropical Tuna Commission

## RISK ANALYSIS FOR MANAGEMENT OF THE TROPICAL TUNA FISHERY IN THE EPO, 2020

Alexandre Aires-da-Silva, Mark N. Maunder, Haikun Xu, Carolina Minte-Vera, Juan L. Valero, Cleridy E. Lennert-Cody

**Document SAC-11-08**

**11<sup>TH</sup> MEETING OF THE SCIENTIFIC ADVISORY COMMITTEE, La Jolla, California (USA)**

**11-15 May 2020**

Postponed until a later date to be determined

# Outline

- Background
  - Previous issues with the EPO tropical tuna assessments
  - Workplan to improve the tropical tuna assessments
  - Uncertainty
- Objectives of the risk analysis
- The staff's pragmatic approach
- Results of the risk analysis
  - Current stock status (YFT and BET)
  - Decision analysis for different durations of the temporal closure
- Conclusions

# Issues with EPO tropical tuna stock assessments

- Management advice based on a “best assessment” approach
- $F$  multiplier from the YFT and BET base case assessment models used to determine the duration of the seasonal closure
- 2018: BET assessment model not reliable enough to determine closure (SAC-09 INF-B)
  - Assessment overly sensitive to new data (mainly for the indices of abundance from the longline fishery)
  - Other issues
- 2019: Same conclusion extended to YFT assessment (SAC-10 INF-F)

# 2018-2020: Workplan to improve the stock assessments of tropical tuna

<b>2017</b>	
Collaboration with Japanese scientists on identifying targeting changes	Report, SAC-09
<b>2018</b>	
February: <a href="#">CAPAM workshop</a> on the development of spatiotemporal models of fishery catch-per-unit-effort data to derive indices of relative abundance ( <a href="#">Special Issue of Fisheries Research</a> )	<a href="#">SAC-09-09</a>
Developing a spatially structured stock assessment for bigeye tuna and other model improvements	Project <a href="#">I.1.a</a>
October: CAPAM workshop on spatial stock assessment models focusing on bigeye tuna	Project <a href="#">X.1.a</a>
<b>2019</b>	
January: <a href="#">Workshop</a> to evaluate differences in bigeye tuna age estimation methods and resulting growth models utilized in current stock assessments by the IATTC and WCPFC	Project <a href="#">E.2.b</a>
February: <a href="#">Workshop</a> to improve the longline indices of abundance of bigeye and yellowfin tunas in the EPO	Project <a href="#">H.1.d</a>
March: <a href="#">Independent review</a> of bigeye assessment ( <a href="#">report</a> )	Project <a href="#">T.1.a</a>
May: SAC-10, exploratory bigeye and yellowfin assessments	<a href="#">SAC-10 INF-G</a>
Oct-Nov: Construct indices of abundance and composition data for longline fleets	Project <a href="#">H.1.e</a>
Nov-Dec: Yellowfin tuna assessment independent review	Project <a href="#">T.1.b</a>
<b>2020</b>	
May: Benchmark bigeye and yellowfin assessments	Report, SAC-11
July: New management recommendations to the Commission	IATTC annual meeting

- Both external reviews suggested a variety of alternative models rather than a replacement for base case
- Change from “best assessment” to a risk analysis approach which considers multiple models

# Uncertainty

- There is uncertainty in stock assessments (e.g. parameter uncertainty, structural/model uncertainty, others)
- IATTC HCR for tropical tunas (Resolution [C-16-02](#)) addresses uncertainty through probability statements:
  - “if the probability that  $F$  will exceed the limit reference point ( $F_{LIMIT}$ ) is greater than 10%, as soon as is practical management measures shall be established that have a probability of at least 50% of reducing  $F$  to the target level ( $F_{MSY}$ ) or less, and a probability of less than 10% that  $F$  will exceed  $F_{LIMIT}$ .”
- Two approaches ongoing which incorporate uncertainty (*Antigua Convention, Precautionary Approach*):
  - Management Strategy Evaluation (MSE): ongoing workplan at IATTC (2018-2023)
  - A new pragmatic risk analysis approach to evaluate the risk of exceeding RPs

# Objectives of the risk analysis

- Current stock status: At current levels of  $F$ , estimate the probability ( $P$ ) (risk) of exceeding  $RPs$  specified in Resolution [C-16-02](#):
  - a)  $P(F > F_{MSY}), P(F > F_{LIMIT})$
  - b)  $P(S < S_{MSY}), P(S < S_{LIMIT})$
- Decision analysis: Under alternative durations of the purse-seine closure, estimate the probability of exceeding the  $RPs$ :
  - a)  $P[F(\text{closure days}) > F_{MSY}], P[F(\text{closure days}) > F_{LIMIT}]$
  - b)  $P[S(\text{closure days}) < S_{MSY}], P[S(\text{closure days}) < S_{LIMIT}]$

# The staff's pragmatic risk analysis approach

Described in Maunder et al. 2020 (SAC-11 INF-F):

- 1. Identify alternative hypotheses** (*'states of nature'*) about the population dynamics of the stock that address the main issues in the assessments
  - **YFT**: SAC-11-J; **BET**: SAC-11 INF-F
- 2. Implement stock assessment models representing alternative hypotheses**
  - **YFT**: SAC-11-07; **BET**: SAC-11-06
- 3. Assign relative weights to each hypothesis (model)**
  - **YFT**: SAC-11 INF-J; **BET**: SAC-11 INF-F
- 4. Compute combined probability distributions for management quantities using model relative weights**
  - **YFT** and **BET**: SAC-11-08

## YFT CURRENT STOCK STATUS

# YFT: $F_{cur}$ probability distributions relative to RPs

## TARGET/OBJETIVO

## LIMIT/LÍMITE

# YFT: $S_{cur}$ probability distributions relative to RPs

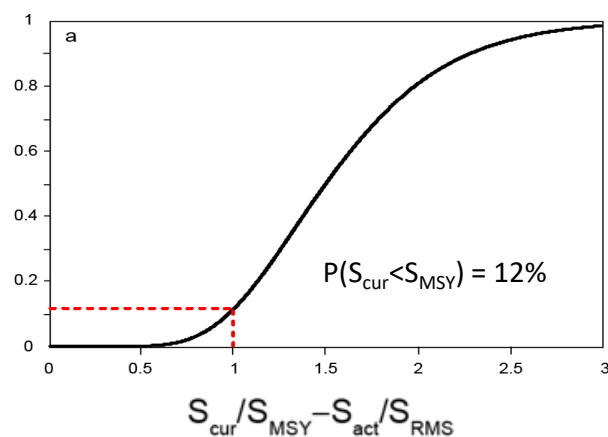

## TARGET/OBJETIVO

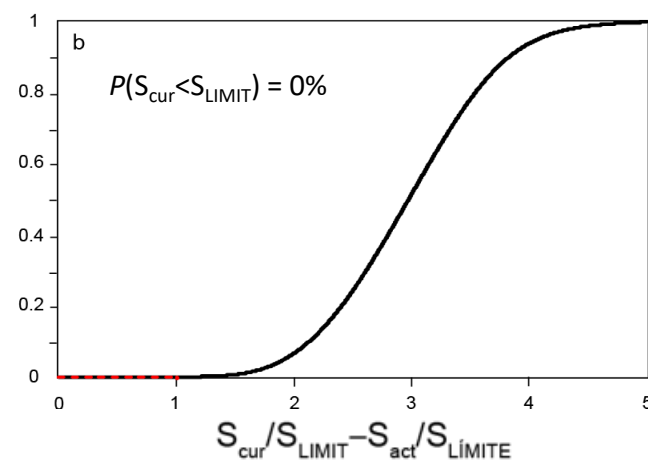

Probability density  
Densidad de probabilidad

Cumulative probability  
Probabilidad acumulativa

## LIMIT/LÍMITE

# YFT: Current stock status (Kobe plot)

- TARGETS

- Only 9% probability that  $F_{MSY}$  has been exceeded:  $P(F_{cur} > F_{MSY}) = 9\%$
- Only 12% probability that  $S_{cur}$  is below  $S_{MSY}$ :  $P(S_{cur} < S_{MSY}) = 12\%$

- LIMITS

- There is zero probability that either  $S$  and  $F$  limit reference points have been exceeded:  
 $P(S_{cur} < S_{LIMIT}) = 0\%$ ;  $P(F_{cur} > F_{LIMIT}) = 0\%$

## BET CURRENT STOCK STATUS

# BET: $F_{cur}$ probability distributions relative to RPs

## TARGET/OBJETIVO

Probability density  
Densidad de probabilidad

Cumulative probability  
Probabilidad acumulativa

## LIMIT/LÍMITE

# BET: $S_{cur}$ probability distributions relative to RPs

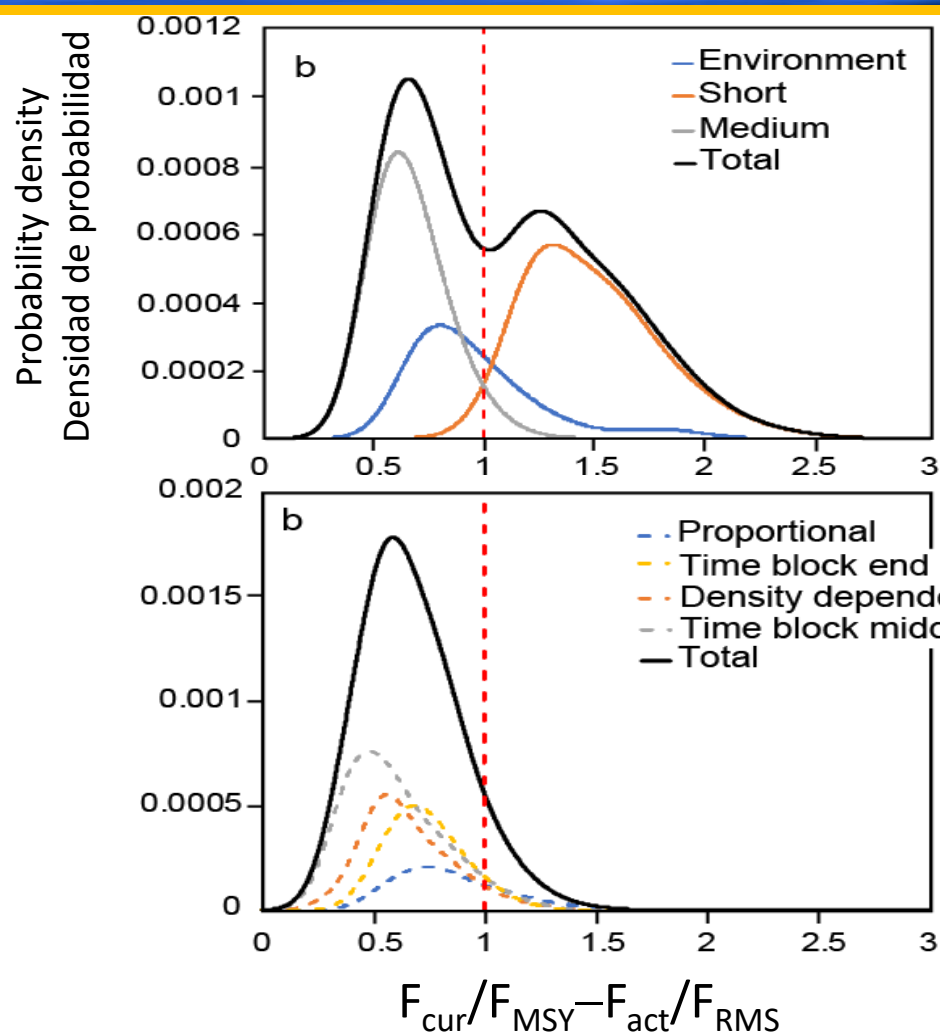

## TARGET/OBJETIVO

## LIMIT/LÍMITE

# BET: Composition of $F_{cur}/F_{MSY}$ prob. distribution

BET

YFT

# BET: Current stock status (Kobe plot)

- TARGETS

- 50% probability that  $F_{MSY}$  has been exceeded:  $P(F_{cur} > F_{MSY}) = 50\%$
- 53% probability that  $S_{cur}$  is below  $S_{MSY}$ :  $P(S_{cur} < S_{MSY}) = 53\%$

- LIMITS

- There probability that either  $S$  and  $F$  limit reference points have been exceeded is not negligible:  
 $P(S_{cur} < S_{LIMIT}) = 6\%$ ;  $P(F_{cur} > F_{LIMIT}) = 5\%$

# DECISION ANALYSIS

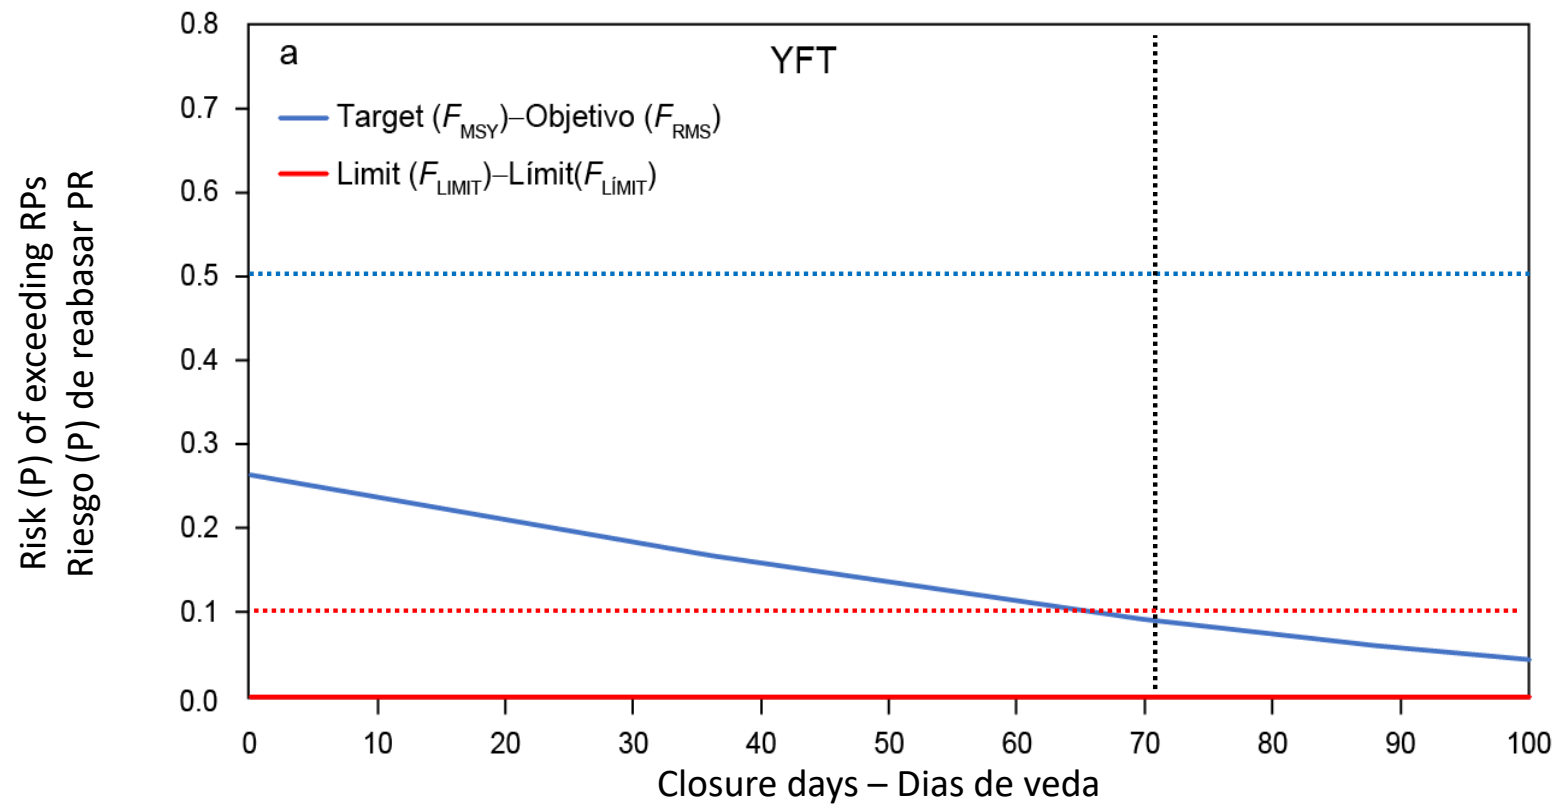

# BET: Decision table

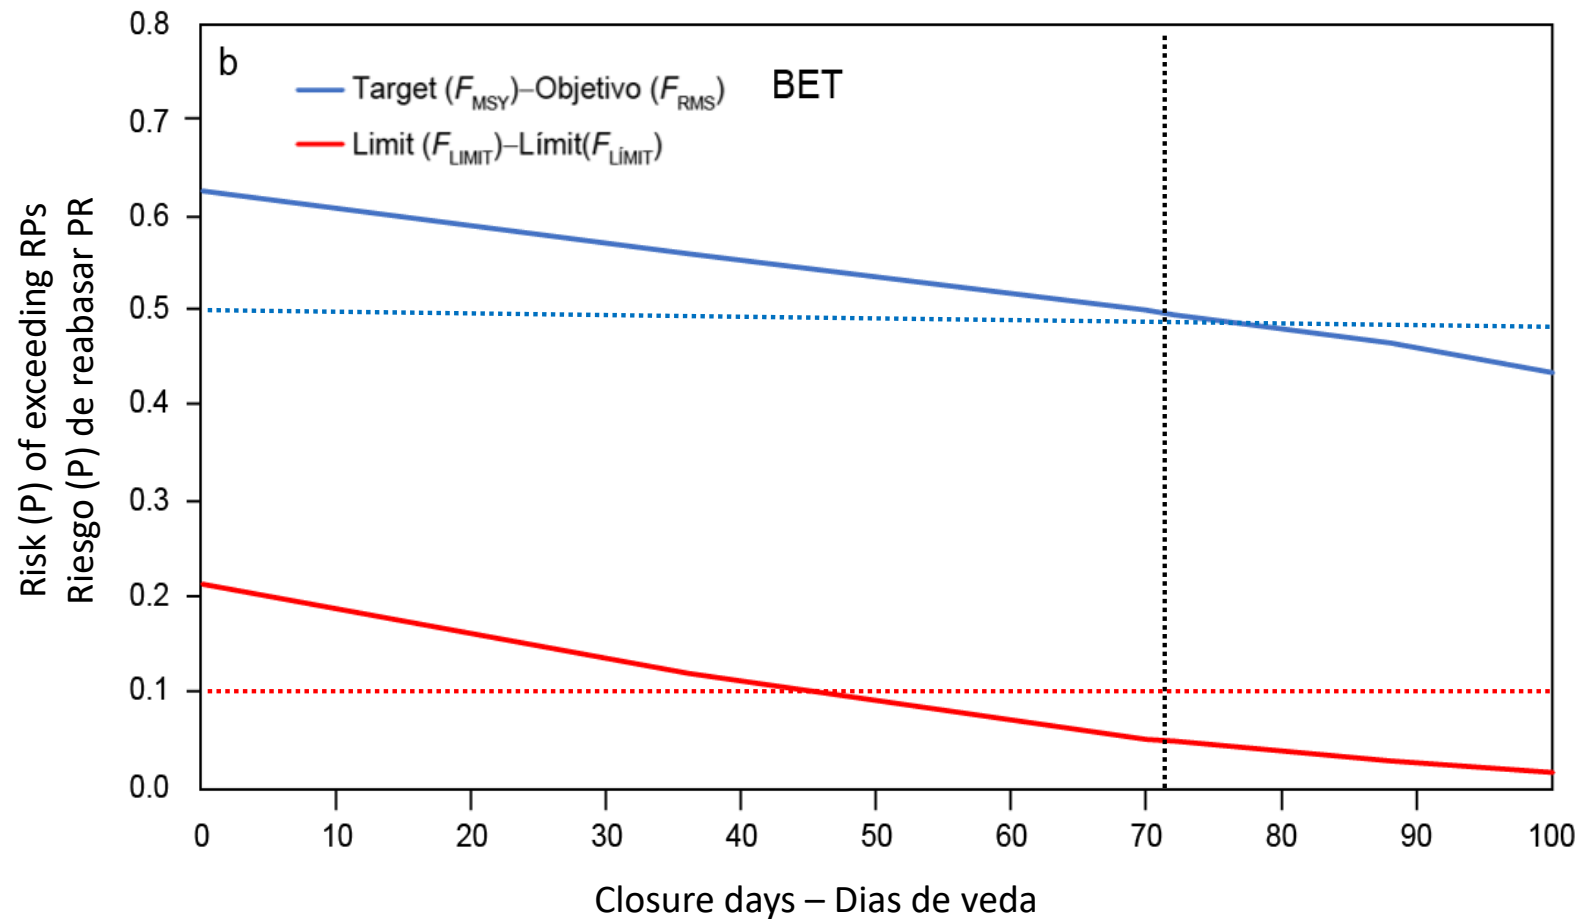

TABLE 4. Decision table for bigeye tuna in the EPO. See explanation of codes in Table BET.													
Closure days	Env-Fix	Env-Gro	Env-Sel	Env-Mrt	Srt-Fix	Srt-Gro	Srt-Sel	Srt-Mrt	Mov	Gro	Sel	Mrt	Comb

# YFT: Risk curves for exceeding RPs

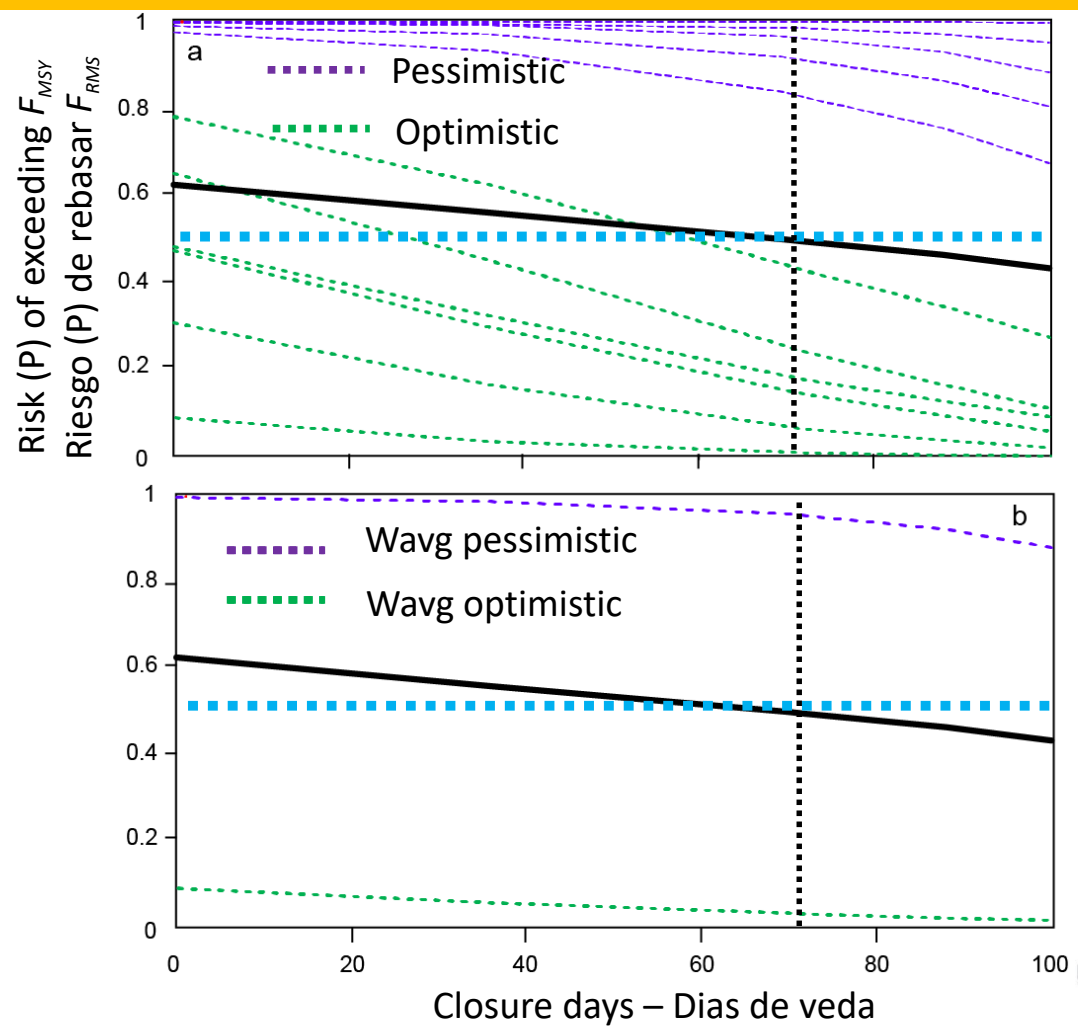

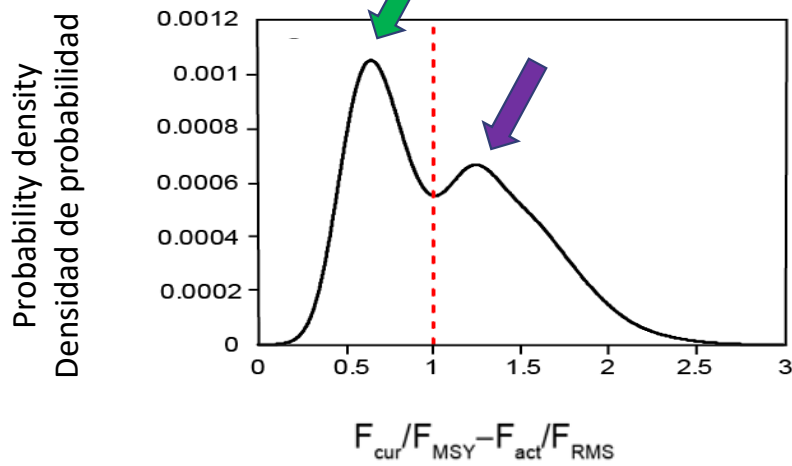

# BET: Risk curves for exceeding RPs

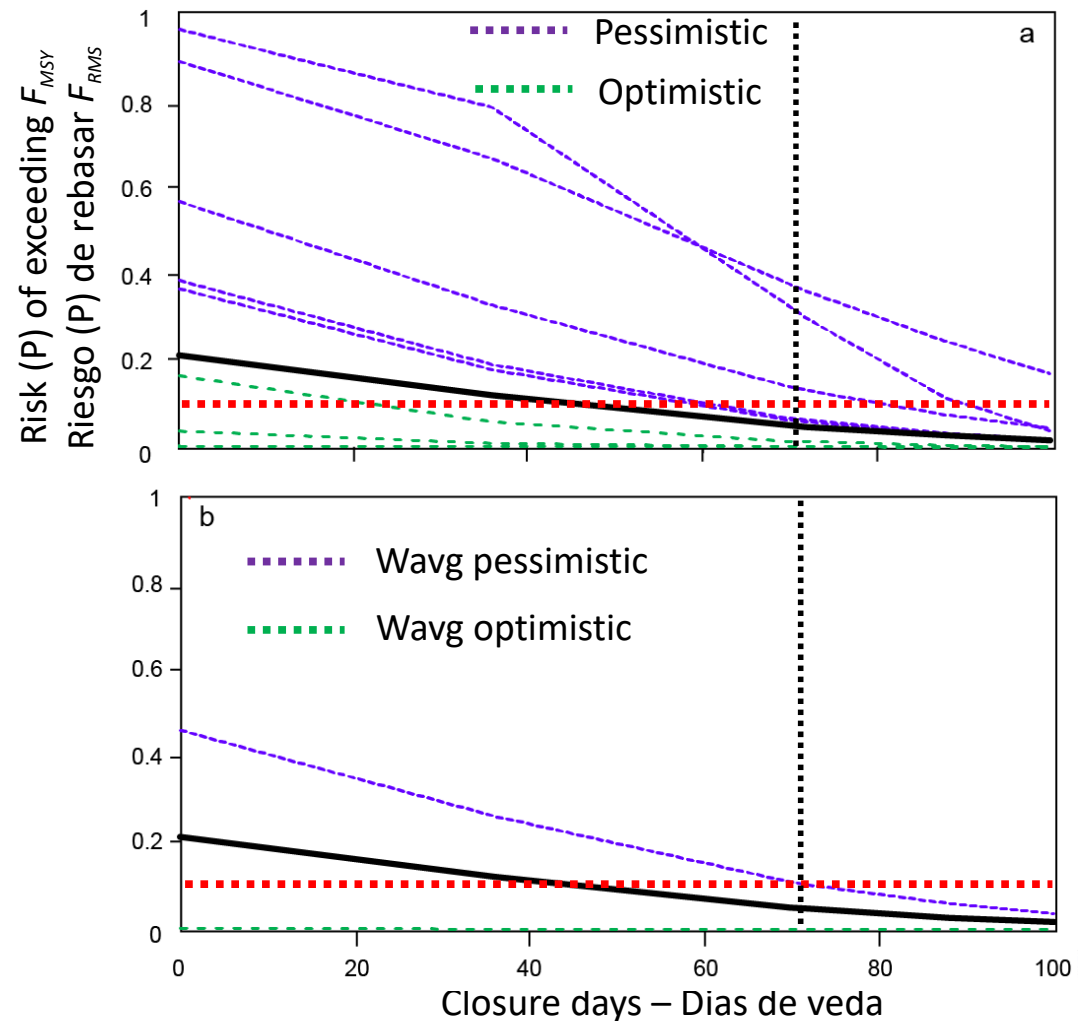

# BET: Risk curves for exceeding $F_{MSY}$

# BET: Risk curves for exceeding $F_{LIMIT}$

# Conclusions: general

- The transition from the “best assessment approach” to risk analysis incorporating uncertainty significantly advances science and the formulation of management advice for tropical tuna at IATTC:
  1. The process resulted in the identification of a set of reference models (alternative *states of nature*)
  2. The approach provides a methodology for assigning relative weights to the plausibility of these alternative hypotheses
  3. The final product are probability statements for exceeding the reference points established in the HCR

# Conclusions: YFT

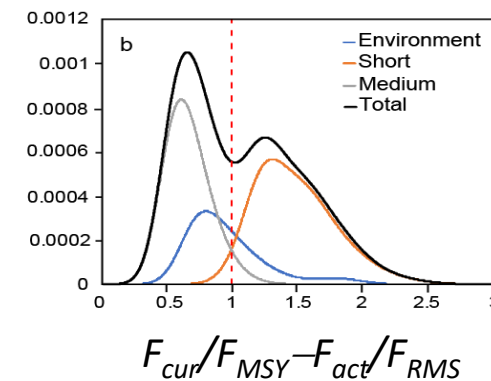

- The risk analysis ambiguously shows that the YFT stock is healthy
  - Targets:  $P(F_{cur} > F_{MSY}) = 9\%$ ,  $P(S_{cur} < S_{MSY}) = 12\%$
  - Limits:  $P(F_{cur} > F_{LIMIT}) = 0\%$ ;  $P(S_{cur} < S_{LIMIT}) = 0\%$

# Conclusions: BET

- The risk analysis results are less clear for BET:
  - Targets:  $P(F_{\text{cur}} > F_{\text{MSY}}) = 50\%$ ,  $P(S_{\text{cur}} < S_{\text{MSY}}) = 53\%$
  - Limits:  $P(F_{\text{cur}} > F_{\text{LIMIT}}) = 5\%$ ;  $P(S_{\text{cur}} < S_{\text{LIMIT}}) = 6\%$
- The bimodal nature of the probability distributions indicates that the stock is either well below or well above the MSY levels
  - At this stage, the risk analysis for BET should not be used for optimal management

# Conclusions: SKJ

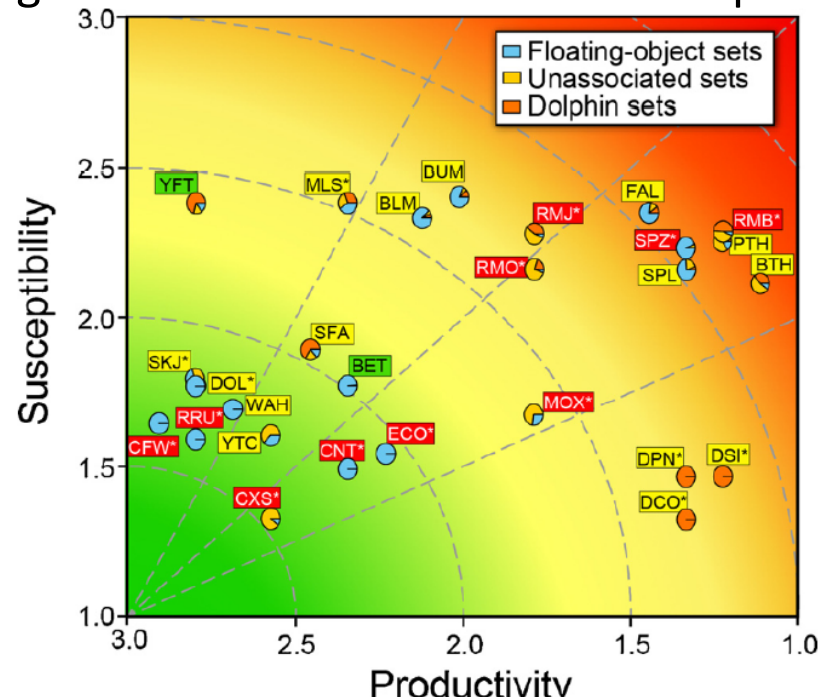

- Traditional stock assessments have not been successful for SKJ
  - High productivity of the stock
  - Strong recruitment fluctuations which are strongly dependent on environment
  - Tagging program ongoing
- SKJ stock status indicators are produced on a yearly basis
  - Long-term trends in catch, catch per set and average size indicate increased  $F$  for SKJ
  - Are these rates sustainable?

# Conclusions: SKJ (cont.)

- PSA rationale
  - SKJ and BET have similar susceptibility
  - SKJ more productive than BET
  - Adequate management measures for BET should protect SKJ

# Staff's recommendations: rationale

- IATTC HCR for tropical tunas (Resolution [C-16-02](#)) addresses uncertainty through probability statements:
  - “if the probability that  $F$  will exceed the limit reference point ( $F_{LIMIT}$ ) is greater than 10%, as soon as is practical management measures shall be established that have a probability of at least 50% of reducing  $F$  to the target level ( $F_{MSY}$ ) or less, and a probability of less than 10% that  $F$  will exceed  $F_{LIMIT}$ .”
- Based on precautionary grounds, the staff takes the risk analysis results of the BET pessimistic models for management advice:
  - $P(F_{cur} > F_{MSY}) = 95\%$ ;  $P(F_{cur} > F_{LIMIT}) = 10\%$
- A status quo harvest strategy (72 day closure) is appropriate in the short-term
  - Since the probability that  $F$  will exceed the  $F_{LIMIT}$  is 10%, the current closure is adequate as long as  $F$  is not increased

# Future work

- Continue Management Strategy Evaluation (MSE) workplan (2018-2023):
  - The IATTC risk analysis calculate  $P$  of exceeding RPs and does not replace MSE process
  - MSE process should be completed to:
    - Further specify management objectives and performance metrics (dialogue)
    - Further specify elements of the current harvest strategy (dialogue)
    - Elicit alternative harvest strategies (dialogue)
    - Evaluate the current and alternative harvest strategies (technical)
- MSE Workplan (through 2023)
  - Recent MSE Workshops
  - Proposal to continue funding after 2020
